Introducción al aprendizaje profundo

Presenta: Hugo Jair Escalante

Mayo 10, 2021

Instituto Nacional de Astrofísica, Óptica y Electrónica

Contenido

- Primer acercamiento a DL
- Modelos lineales: redes no profundas!
- Redes neuronales profundas
- Desmenuzando a las redes neuronales
- Entrenamiento de redes neuronales

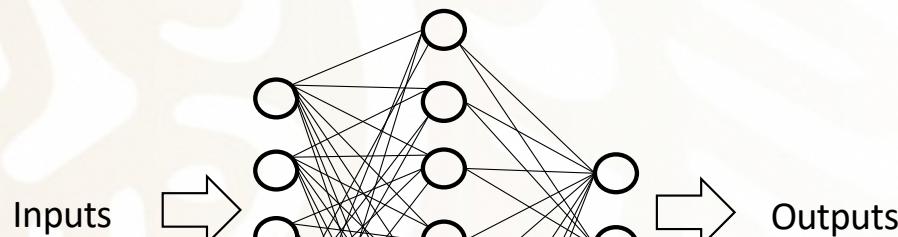

Aprendizaje profundo
un primer acercamiento

En breve...

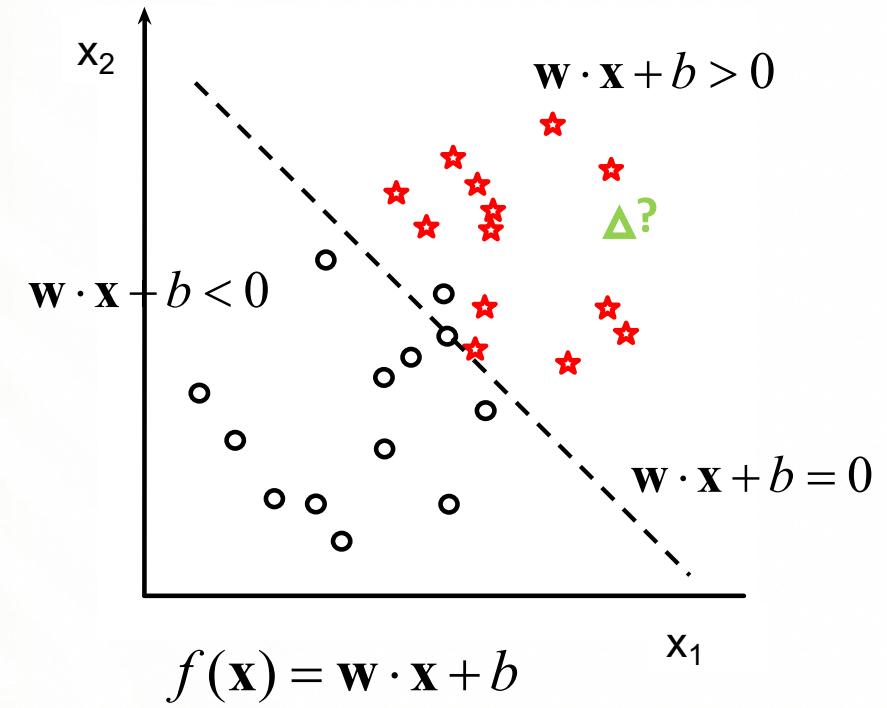

- DL es una metodología del aprendizaje computacional que intenta resolver problemas de modelado construyendo modelos apilados en capas de parámetros de abstracción incremental
- Las capas de estos modelos capturan información descriptiva/discriminativa a partir de los datos *crudos*
- Pueden usarse para tareas de aprendizaje supervisado, no supervisado, por refuerzo, extracción de atributos, modelado probabilista, etc.
- Ejemplos: MLPs, DNNs, CNNs, DBNs, Aes, etc.

En breve...

- Cómo se ve un modelo no profundo?

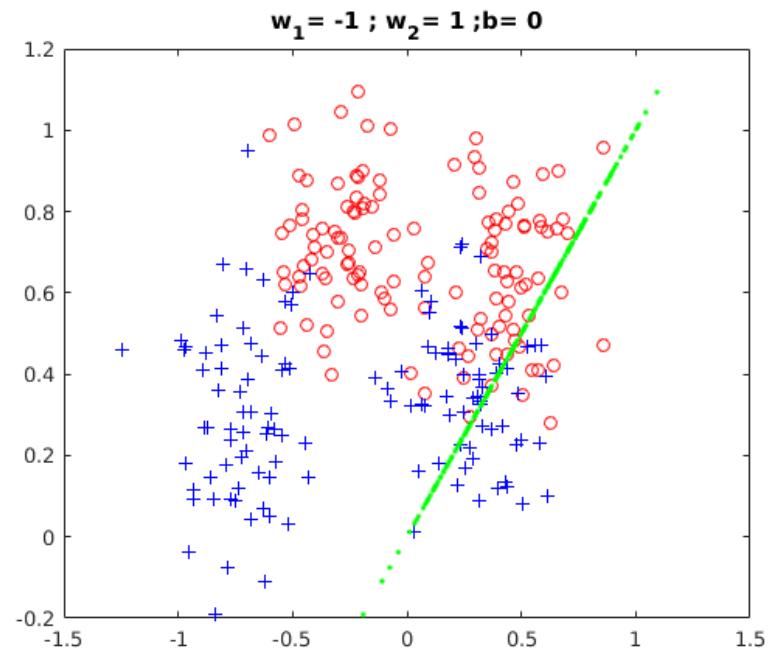

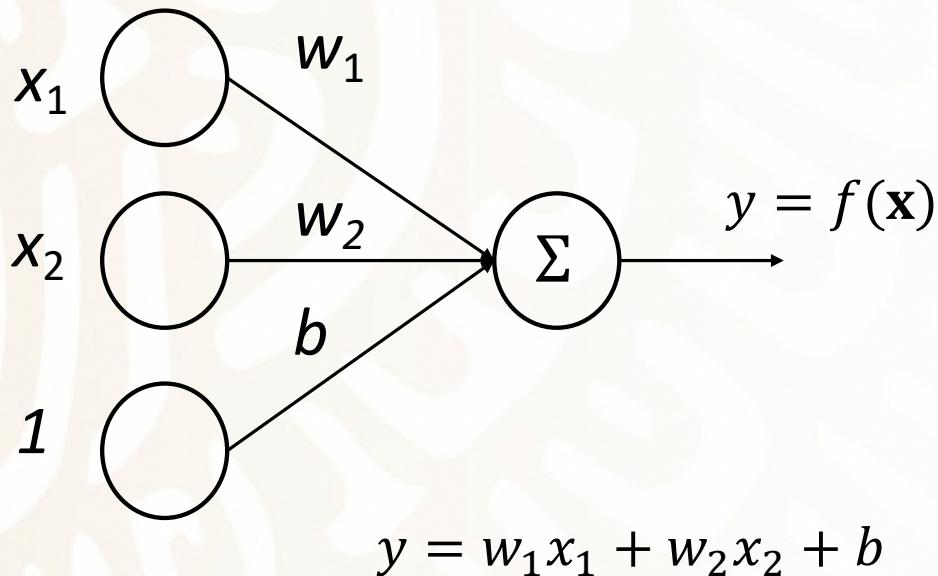

$$f(\mathbf{x}) = \mathbf{w} \cdot \phi(\mathbf{x}) + b$$

Flashback: el perceptrón

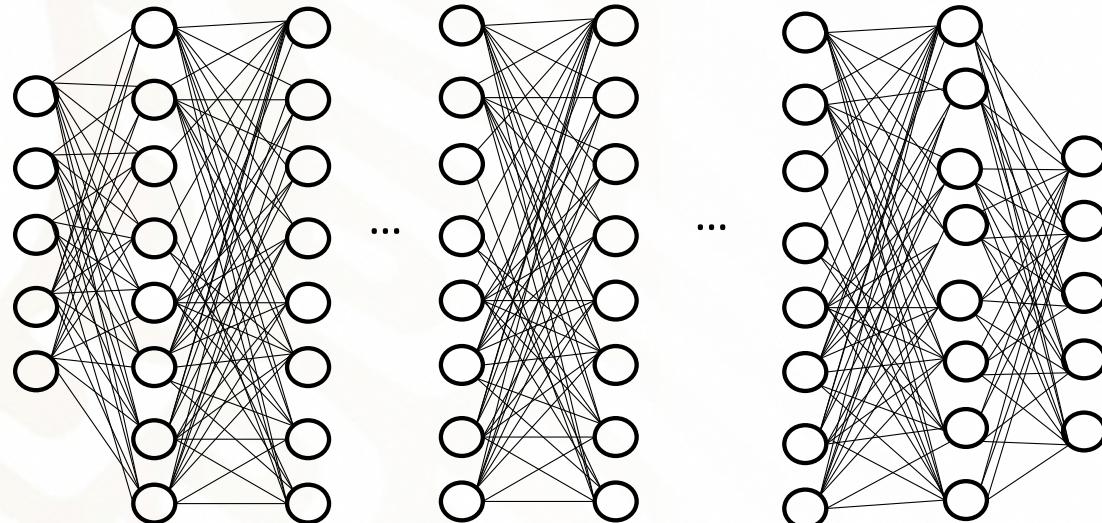

- El perceptrón aprende una función de decisión de la forma:

$$f(\mathbf{x}) = \text{sign}(\mathbf{w}\mathbf{x} + b), \text{ with } \mathbf{w} \in \mathbb{R}^d$$

En breve...

- Cómo se ve un modelo (no tan) profundo?

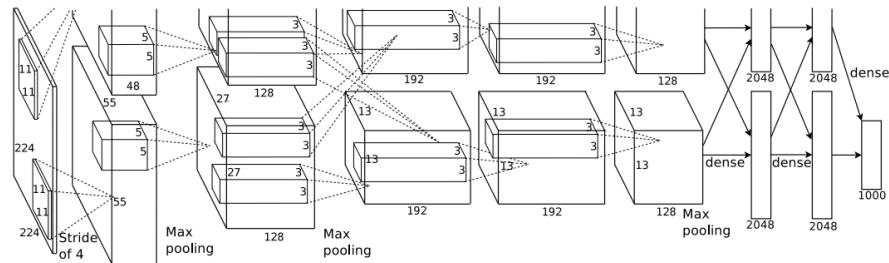

$$f(x) = \mathbf{W}_3\phi_3(\mathbf{W}_2\phi_2(\mathbf{W}_1\phi_1(x) + b) + b_2) + b_3$$

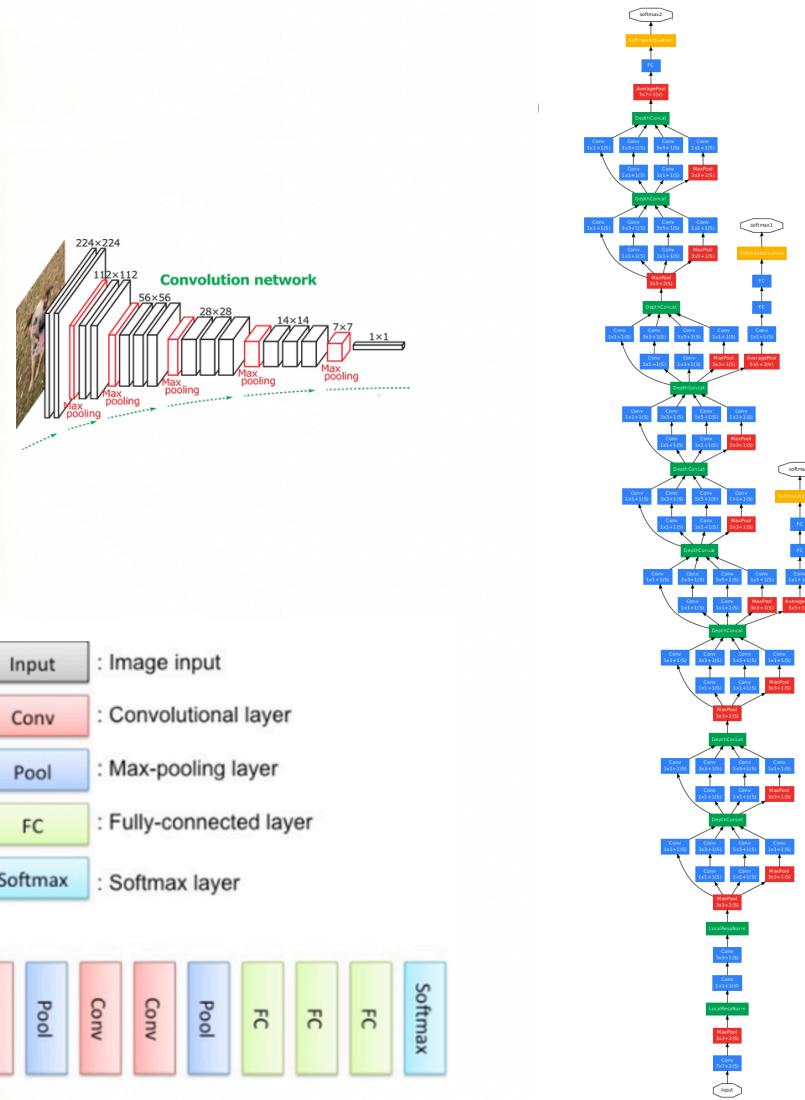

En breve...

- Más profundidad (CNNs)

VGGNet

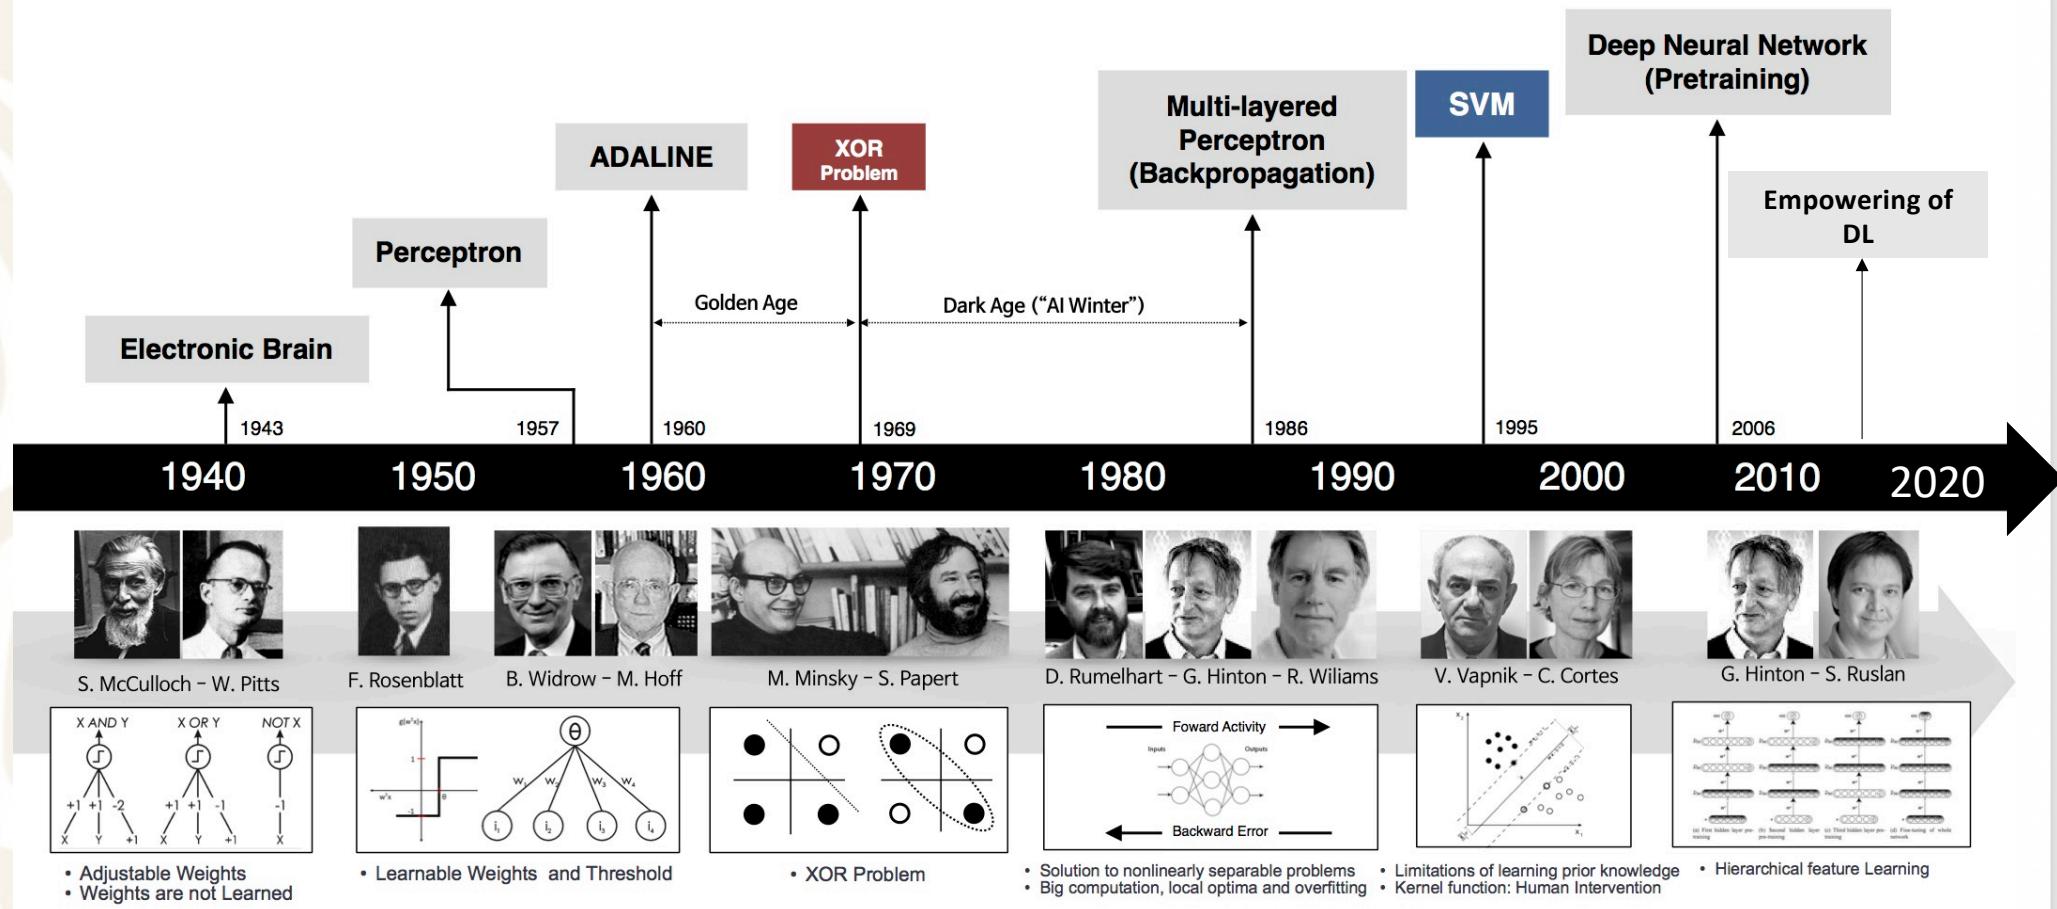

En breve...

- Características del aprendizaje profundo:
 - Un gran número de parámetros (del orden de millones)
 - Requiere de grandes cantidades de datos para ser entrenado
 - Puede aprender a extraer atributos para caracterizar datos crudos
 - Puede tomar ventaja de datos no etiquetados
 - Modelos extremadamente complejos
 - Requieren de hardware especializado para entrenamiento eficiente
 - Dominan los campos de aplicación de aprendizaje computacional (e.g., NLP, visión computacional)

El Boom de DL: breve historia

http://beamandrew.github.io/deeplearning/2017/02/23/deep_learning_101_part1.html

A.M. TURING

The A.M. Turing Award, sometimes referred to as the "Nobel Prize of Computing," was named in honor of Alan Mathison Turing (1912–1954), a British mathematician and computer scientist. He made fundamental advances in computer architecture, algorithms, formalization of computing, and artificial intelligence. Turing was also instrumental in British code-breaking work during World War II.

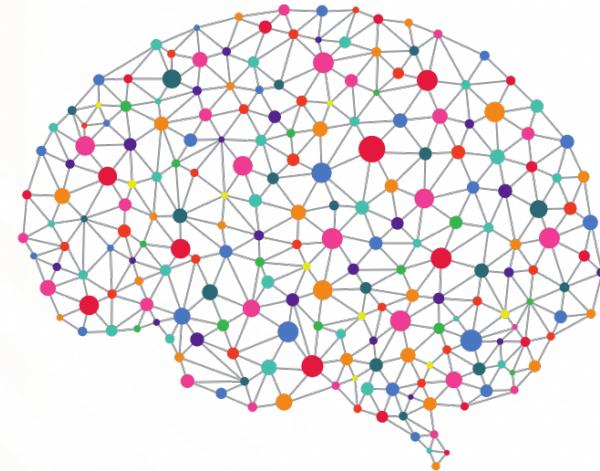

FATHERS OF THE DEEP LEARNING REVOLUTION RECEIVE ACM A.M. TURING AWARD

Bengio, Hinton, and LeCun Ushered in Major Breakthroughs in Artificial Intelligence

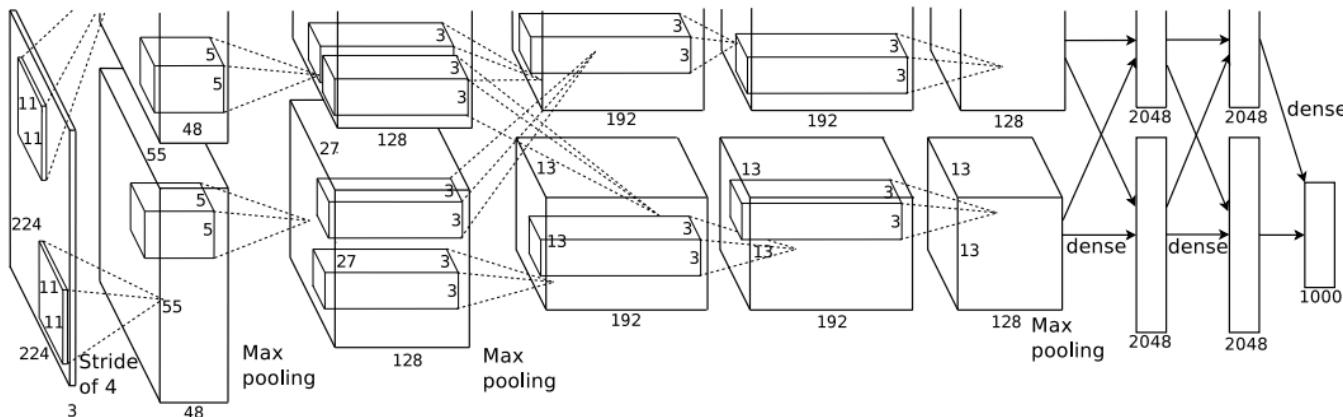

El Boom de DL: logros importantes

- Clasificación de imágenes a gran escala
- Reconocimiento de voz
- Reconocimiento de rostros
- Aprendizaje profundo por refuerzo
- Otros logros
 - Image captioning
 - Word embeddings
 - Reconocimiento de gestos, acciones
 - Super resolución
 - ...

Logros importantes I (ImageNET)

- En 2012, Krizhevsky et al. lograron entrenar una red convolucional usando ~1 millón de imágenes para enfrentar el concurso *ImageNET large scale classification challenge* (1000 categorías, millones de imágenes)

IMAGENET

Alex Krizhevsky, Ilya Sutskever, Geoffrey E. Hinton. *ImageNet Classification with Deep Convolutional Neural Networks*. Advances in Neural Information Processing Systems 25 (NIPS 2012)

ImageNET Challenge

- ImageNET: un recurso compuesto por millones de imágenes
- Imágenes de la Web descargadas a partir de los synsets de WordNet
- Tareas:
 - Clasificación
 - Detección de objetos
 - Localización de objetos

IMAGENET

Year	Train images (per class)	Val images (per class)	Test images (per class)
Image classification annotations (1000 object classes)			
ILSVRC2010	1,261,406 (668–3047)	50,000 (50)	150,000 (150)
ILSVRC2011	1,229,413 (384–1300)	50,000 (50)	100,000 (100)
ILSVRC2012-14	1,281,167 (732–1300)	50,000 (50)	100,000 (100)

The numbers in parentheses correspond to (minimum per class–maximum per class). The 1000 classes change from year to year but are consistent between image classification and single-object localization tasks in the same year. All images from the image classification task may be used for single-object localization

Logros importantes I (ImageNET)

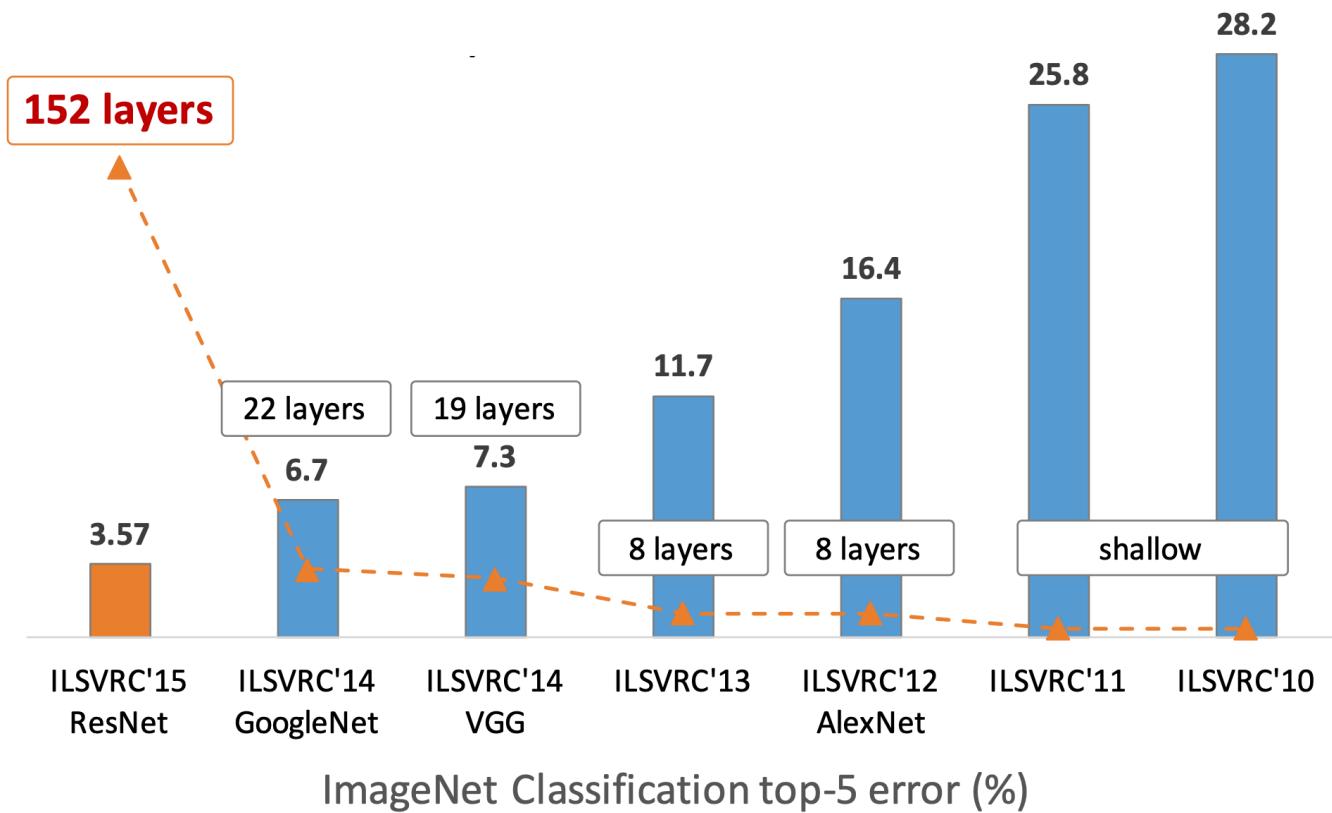

- Las mejoras de desempeño obtenidas por AlexNet fueron impresionantes
- Las claves de este logro:
 - Hardware: GPUs
 - Funciones de activación RELU
 - Regularización dropout
 - Big data / modelo complejo

Model	Top-1	Top-5
<i>Sparse coding [2]</i>	47.1%	28.2%
<i>SIFT + FVs [24]</i>	45.7%	25.7%
CNN	37.5%	17.0%

Model	Top-1 (val)	Top-5 (val)	Top-5 (test)
<i>SIFT + FVs [7]</i>	—	—	26.2%
1 CNN	40.7%	18.2%	—
5 CNNs	38.1%	16.4%	16.4%
1 CNN*	39.0%	16.6%	—
7 CNNs*	36.7%	15.4%	15.3%

Logros importantes I (ImageNET)

IMAGENET

Kaiming He, Xiangyu Zhang, Shaoqing Ren, & Jian Sun. "Deep Residual Learning for Image Recognition". CVPR 2016

Logros importantes I (ImageNET)

- AlexNet es hoy en día (quizá) la arquitectura más usada para clasificar imágenes, se incluye en la mayoría de las librerías de DL
- Este logro inspiró a otros en el área de visión computacional, eventualmente estableciendo a DL como *la metodología* para entender escenas

Imagenet classification with deep convolutional neural networks

Authors Alex Krizhevsky, Ilya Sutskever, Geoffrey E Hinton

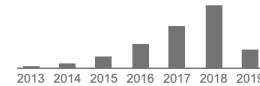

Publication date 2012

Conference Advances in neural information processing systems

Pages 1097-1105

Description We trained a large, deep convolutional neural network to classify the 1.3 million high-resolution images in the LSRC-2010 ImageNet training set into the 1000 different classes. On the test data, we achieved top-1 and top-5 error rates of 39.7% and 18.9% which is considerably better than the previous state-of-the-art results. The neural network, which has 60 million parameters and 500,000 neurons, consists of five convolutional layers, some of which are followed by max-pooling layers, and two globally connected layers with a final 1000-way softmax. To make training faster, we used non-saturating neurons and a very efficient GPU implementation of convolutional nets. To reduce overfitting in the globally connected layers we employed a new regularization method that proved to be very effective.

Better Language Models and Their Implications

We've trained a large-scale unsupervised language model which generates coherent paragraphs of text, achieves state-of-the-art performance on many language modeling benchmarks, and performs rudimentary reading comprehension, machine translation, question answering, and summarization—all without task-specific training.

Modelos lineales: Clasificación

Modelos lineales para clasificación

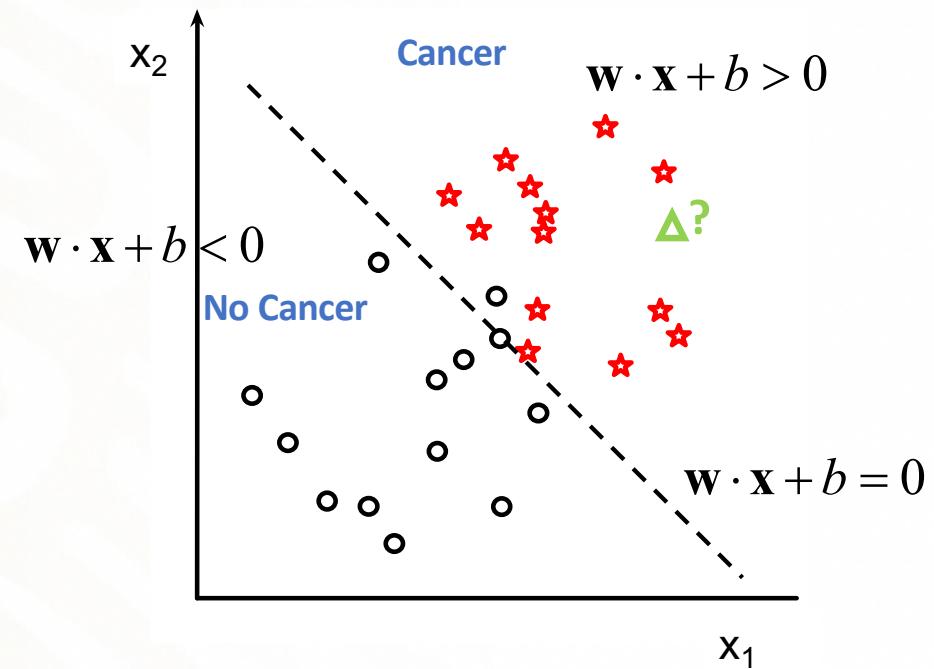

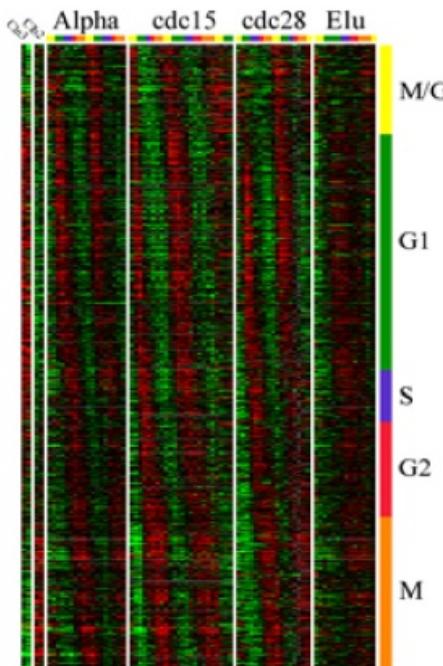

- **Idea:** aprender una función lineal (en los parámetros) que nos permita separar los datos:

$$\bullet \quad f(\mathbf{x}) = \mathbf{w} \bullet \mathbf{x} + b = \sum_{j=1:n} w_j x_j + b \quad (\textit{linear discriminant})$$

$$\circ \quad f(\mathbf{x}) = \mathbf{w} \bullet \Phi(\mathbf{x}) + b = \sum_j w_j \phi_j(\mathbf{x}) + b \quad (\textit{the perceptron})$$

$$\circ \quad f(\mathbf{x}) = \sum_{i=1:m} \alpha_i k(\mathbf{x}_i, \mathbf{x}) + b \quad (\textit{Kernel-based methods})$$

Modelos lineales para clasificación

$$\mathbf{x} = \langle \mathbf{x}_1, \mathbf{x}_2 \rangle$$

$$f(\mathbf{x}) = \mathbf{w} \cdot \mathbf{x} + b$$

Modelos lineales para clasificación

El perceptrón

- **Perceptron:** Un clasificador lineal simple que puede resolver problemas de clasificación que son linealmente separables (“abuelo” de las redes neuronales y las máquinas de soporte vectorial)
- El perceptron aprende una función de decisión de la forma:

$$f(\mathbf{x}) = \text{sign}(\mathbf{w}\mathbf{x} + b), \text{ with } \mathbf{w} \in \mathbb{R}^d$$

El perceptrón

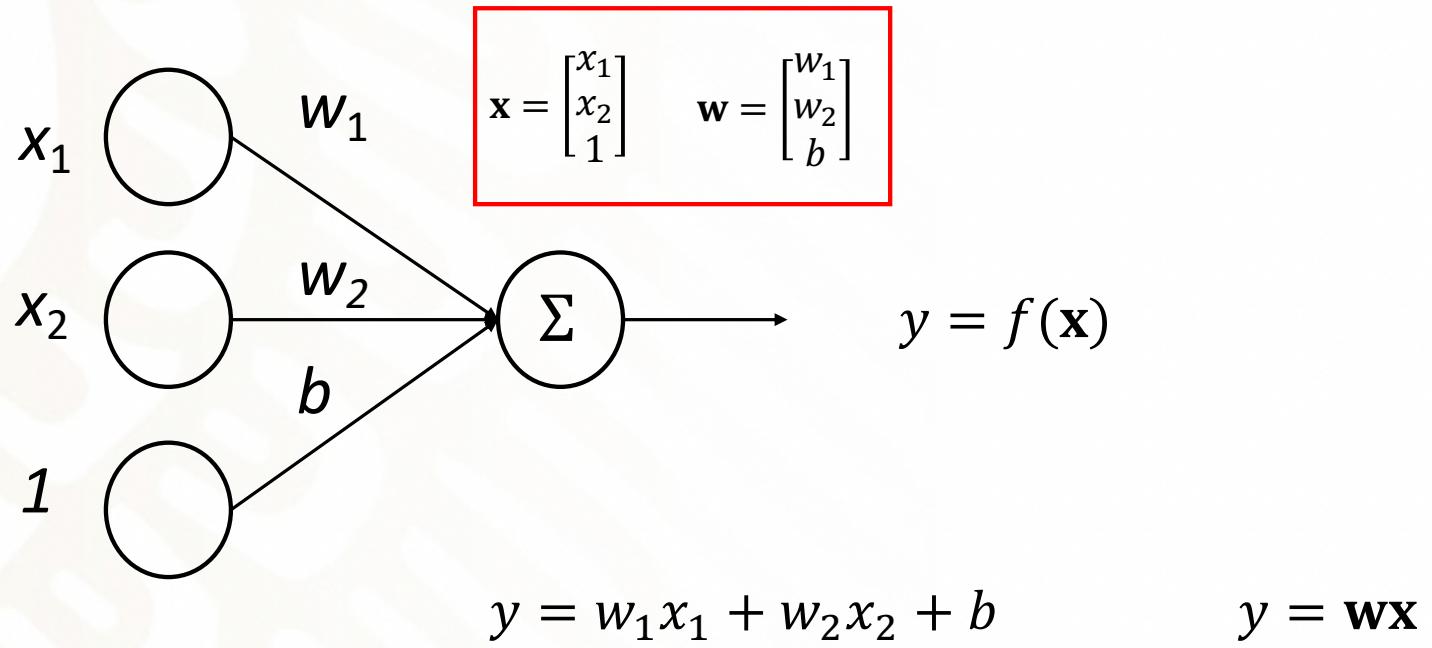

- Dado: $D = \{(\mathbf{x}_i, y_i)_{1,\dots,N}\}$, with $x_i \in \mathbb{R}^d$ and $y_i \in \{-1, 1\}$

El perceptrón

- El perceptron aprende una función de decisión de la forma:

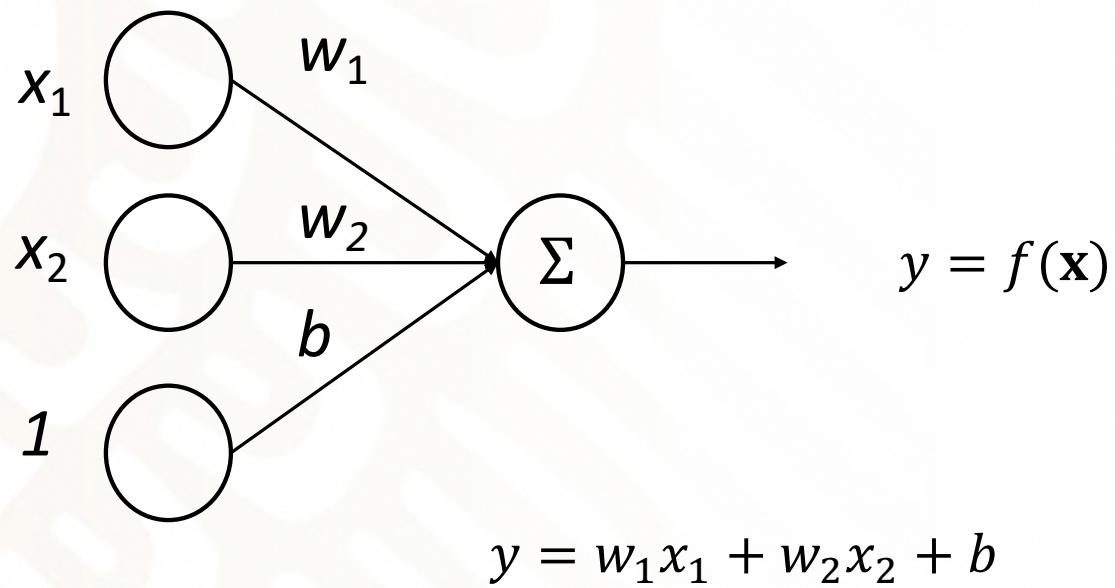

$$f(\mathbf{x}) = \text{sign}(\mathbf{w}\mathbf{x} + b), \text{ with } \mathbf{w} \in \mathbb{R}^d$$

El perceptrón

- El perceptron aprende una función de decisión de la forma:

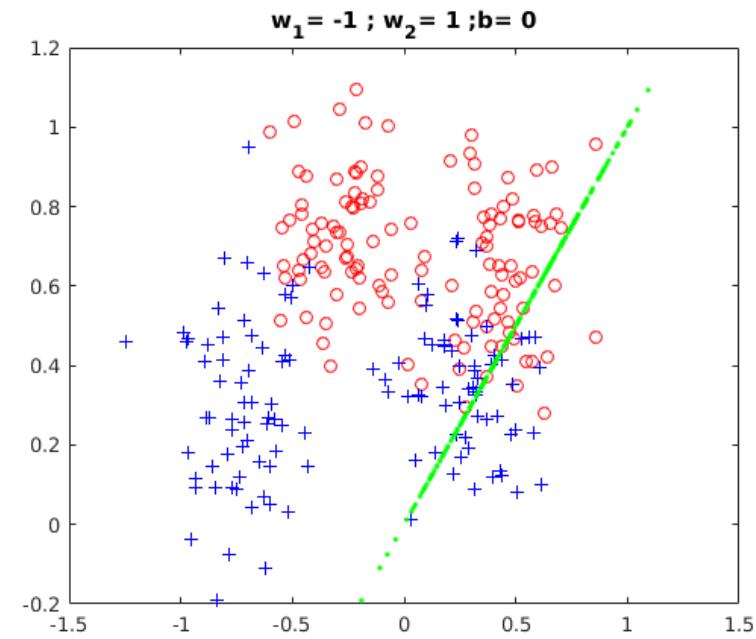

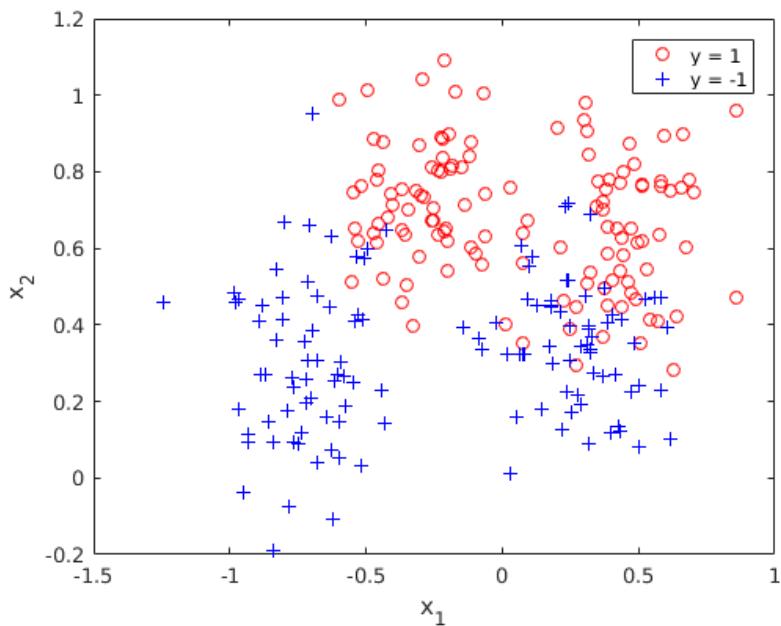

$$f(\mathbf{x}) = \text{sign}(\mathbf{w}\mathbf{x} + b), \text{ with } \mathbf{w} \in \mathbb{R}^d$$

El perceptrón

- El perceptron aprende una función de decisión de la forma:

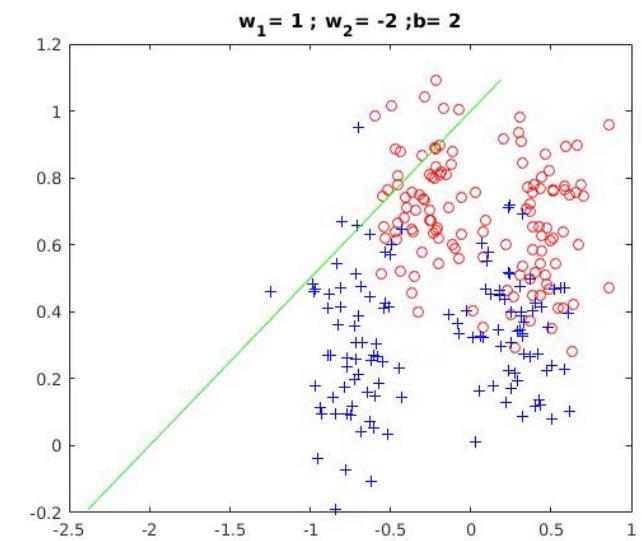

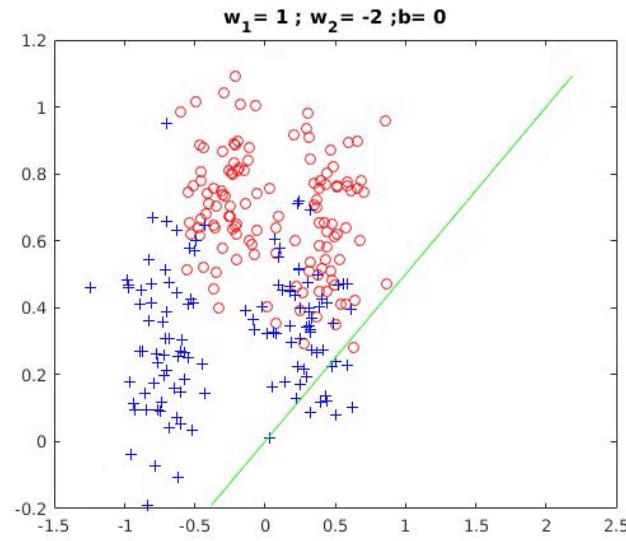

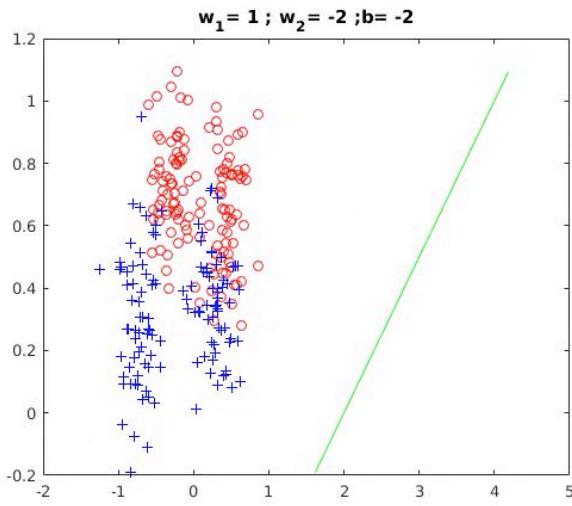

$$f(\mathbf{x}) = \text{sign}(\mathbf{w}\mathbf{x} + b), \text{ with } \mathbf{w} \in \mathbb{R}^d$$

El perceptrón

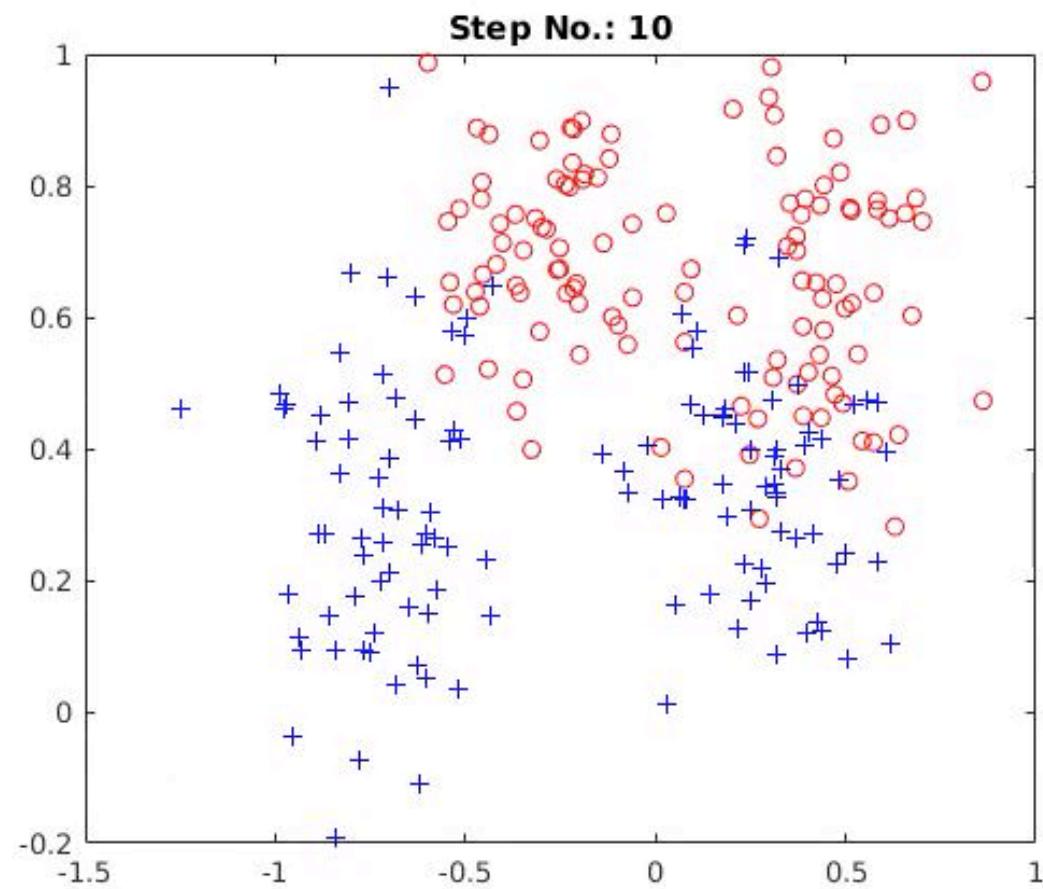

- Diferentes parámetros resultan en diferentes modelos

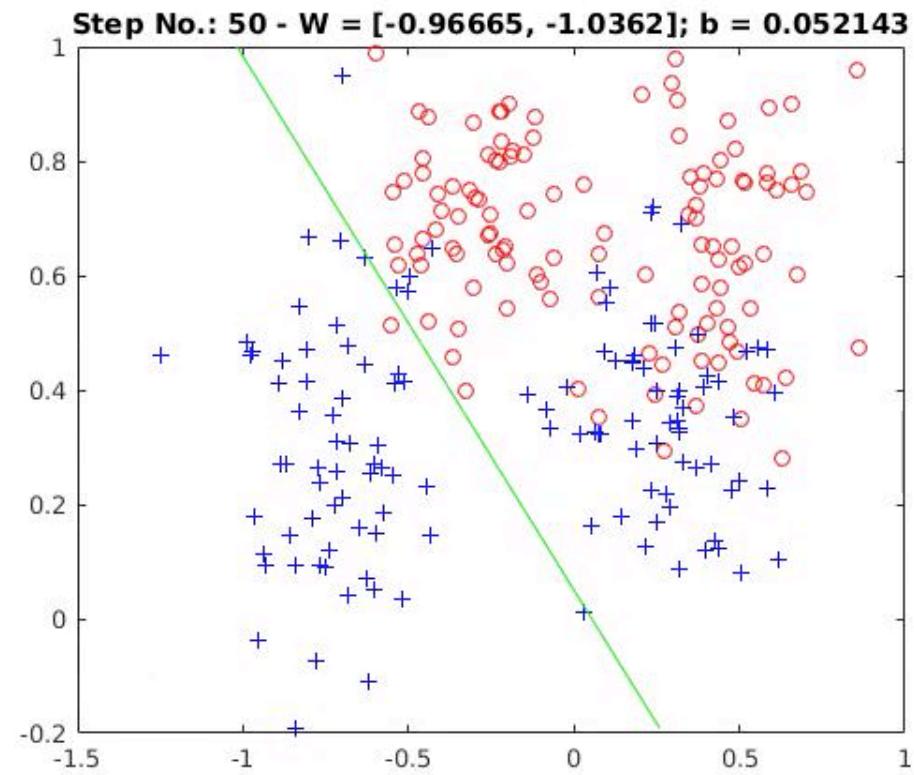

El perceptrón

- Cómo estimar los pesos \mathbf{w} ?
 - El algoritmo de aprendizaje del perceptron
1. $\mathbf{w} \leftarrow$ inicializar con valores aleatorios
 2. Repetir hasta que se alcanza criterio de paro:
 - I. Por cada $\mathbf{x}_i \in D$
 - a) $o_i \leftarrow \text{sign}(\mathbf{w}\mathbf{x}_i + b)$ // Estimar la predicción del perceptron
 - b) $\Delta\mathbf{w} \leftarrow \eta(y_i - o_i)$ // Estimar la razón de cambio
 - c) $\mathbf{w} \leftarrow \mathbf{w} + \Delta\mathbf{w}$ // Actualizar w
 3. Regresa \mathbf{w}
 - Convergencia está garantizada (para problemas linealmente separables)

El perceptrón en acción

Redes neuronales profundas

En breve...

- DL es una metodología del aprendizaje computacional que intenta resolver problemas de modelado construyendo modelos apilados en capas de parámetros de abstracción incremental

Redes neuronales profundas (DNNs)

- Las redes neuronales representan el modelo *esencial* de aprendizaje profundo
- Por lo tanto, las redes neuronales *feedforward* (MLP) son la base del aprendizaje profundo
- Convencionalmente, se dice que una red es profunda si tiene al menos 2 capas ocultas

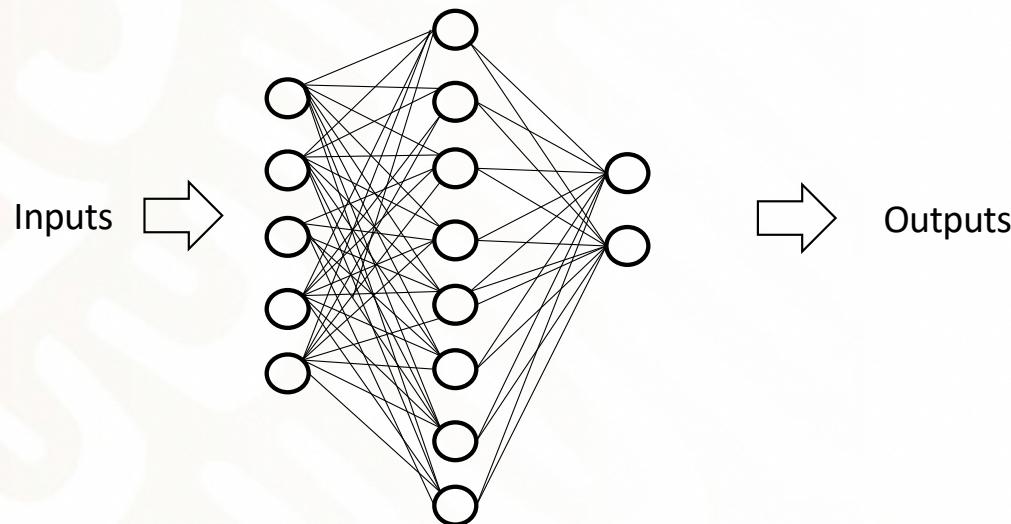

DNNs

$$f(\mathbf{x}) = s(\mathbf{w}\phi(\mathbf{x}) + b)$$

$$\phi(\mathbf{x}) = s(\mathbf{u}\mathbf{x} + c)$$

- Una red neuronal tipo *feedforward* es un modelo que:
 - Aproxima funciones de la forma $y = f(x; \Theta)$
 - Se compone de múltiples funciones no lineales organizadas en capas
 - Las capas forman a su vez la red
 - La información fluye en una sola dirección, hacia adelante

DNNs

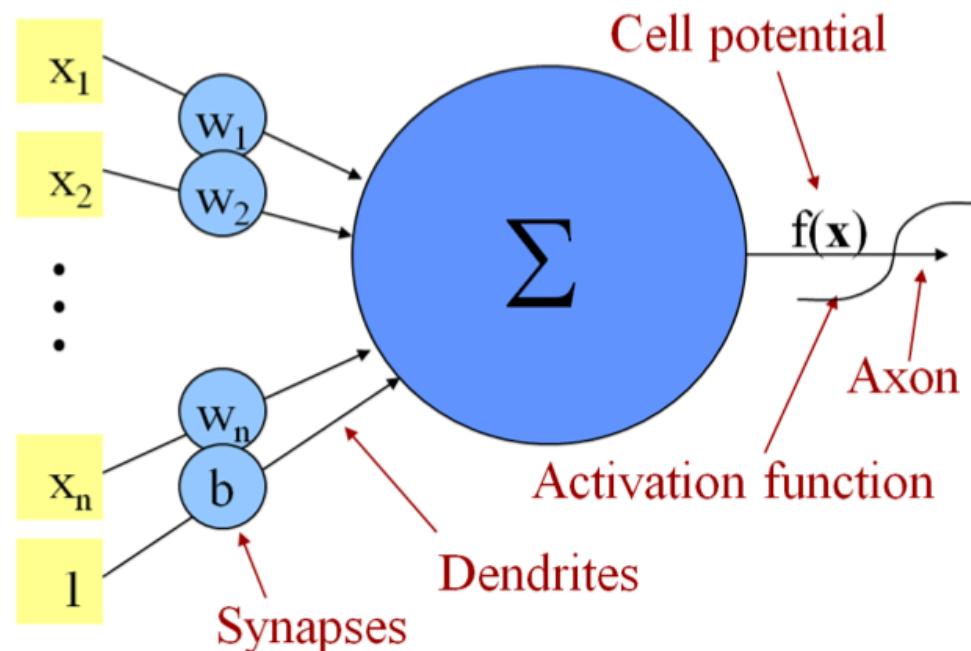

$$f(\mathbf{x}) = s(\mathbf{w}\phi(\mathbf{x}) + b)$$

$$\phi(\mathbf{x}) = s(\mathbf{u}\mathbf{x} + c)$$

- Analogía con una neurona

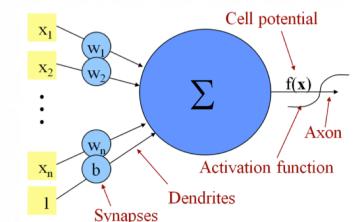

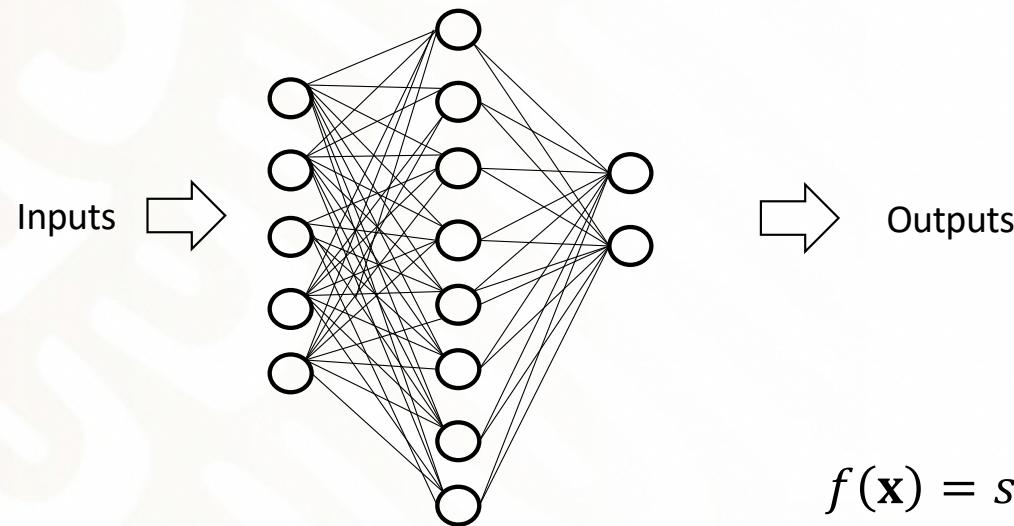

Activation

Desmenuzando una red neuronal

DNNs

- En general, las redes neuronales están construidas por muchas unidades similares al perceptrón (unidades lineales activadas por una función no lineal que es diferenciable)
- **Perceptrón:** Clasificador lineal simple que puede resolver problemas de clasificación linealmente separables (ancestro de DNNs y de la SVM)

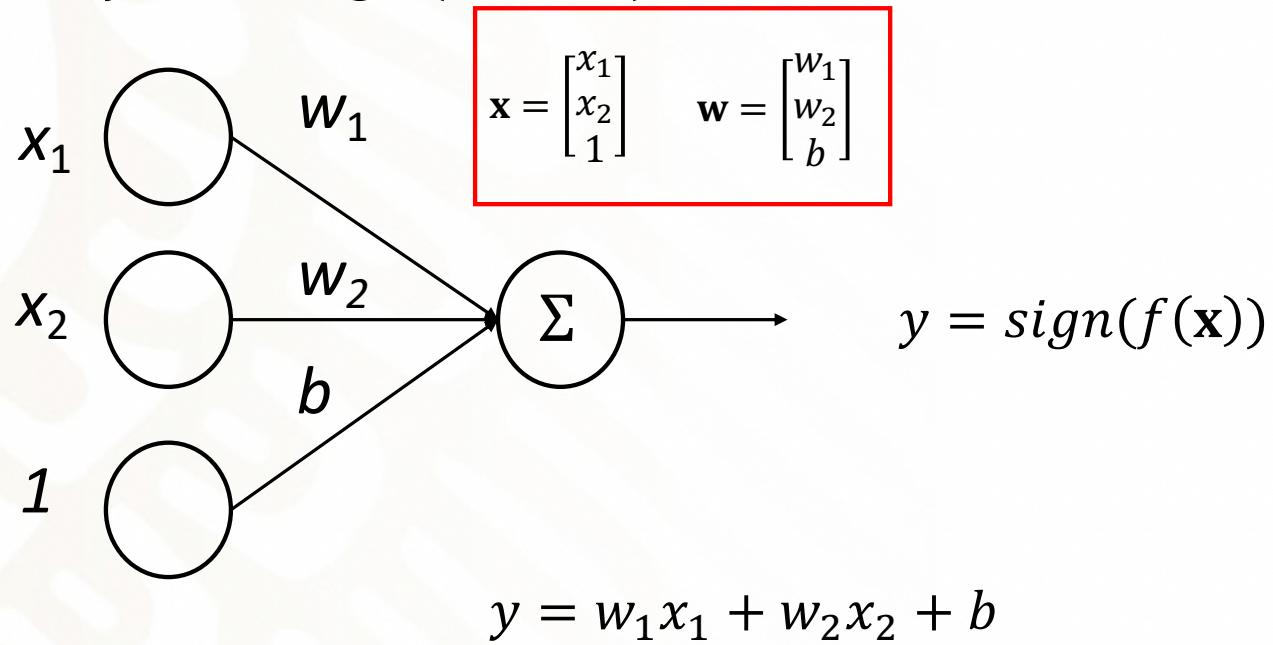

El perceptrón

- Dado: $D = \{(\mathbf{x}_i, y_i)_{1, \dots, N}\}$, with $x_i \in \mathbb{R}^d$ and $y_i \in \{-1, 1\}$
- El perceptrón aprende una función de decisión de la forma:

$$f(\mathbf{x}) = \text{sign}(\mathbf{w}\mathbf{x} + b), \text{ with } \mathbf{w} \in \mathbb{R}^d$$

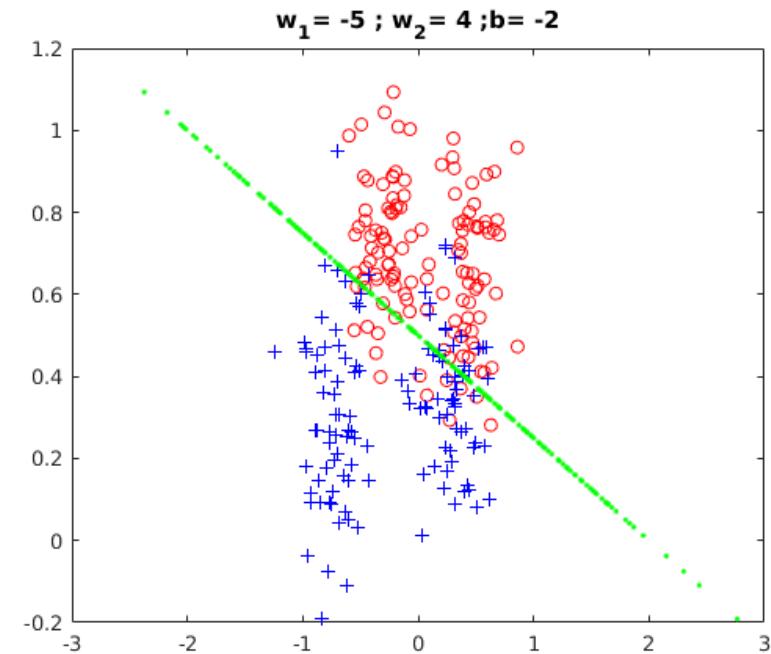

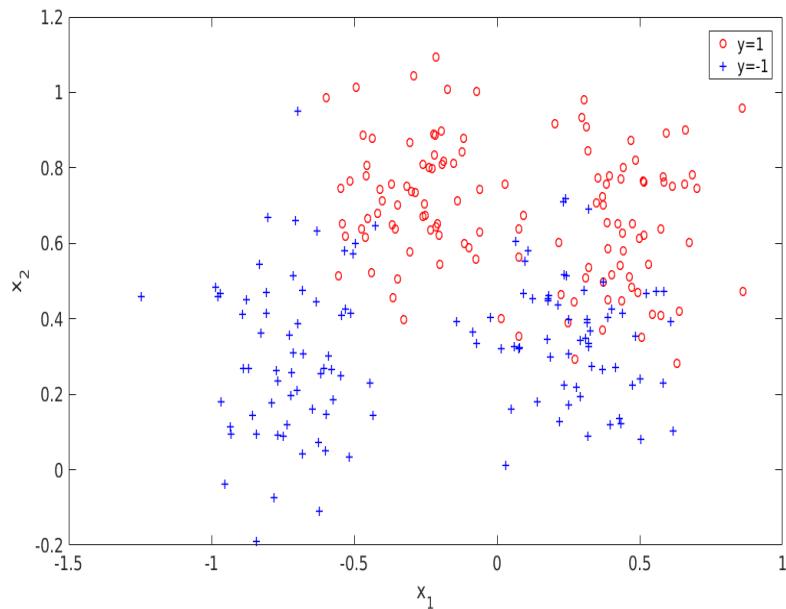

El perceptrón

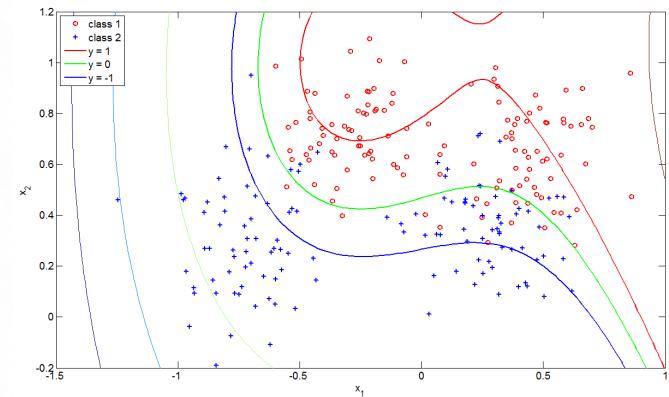

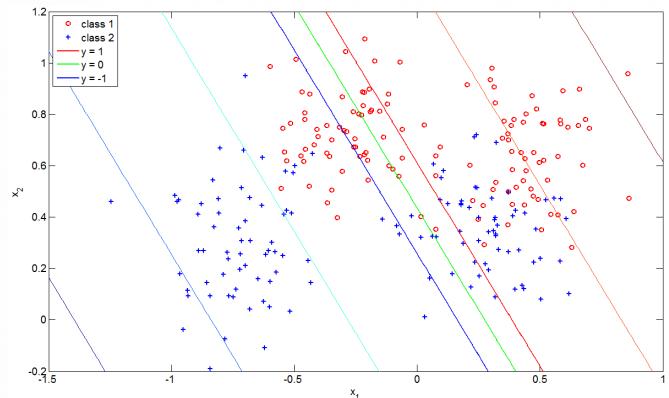

- Dado: $D = \{(\mathbf{x}_i, y_i)_{1, \dots, N}\}$, with $x_i \in \mathbb{R}^d$ and $y_i \in \{-1, 1\}$
- El perceptron aprende una función de decisión de la forma:

$$f(\mathbf{x}) = \text{sign}(\mathbf{w}\mathbf{x} + b), \text{ with } \mathbf{w} \in \mathbb{R}^d$$

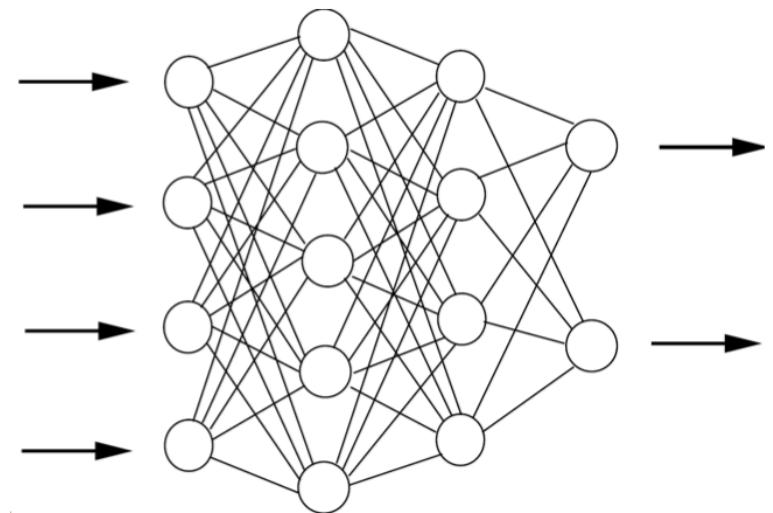

Unidades no lineales

- El problema con estos modelos lineales es que solamente pueden aprender funciones de este tipo
- Alternativas:
 - Mapear los datos a otro espacio (no lineal) donde el problema sea linealmente separable

Unidades no lineales

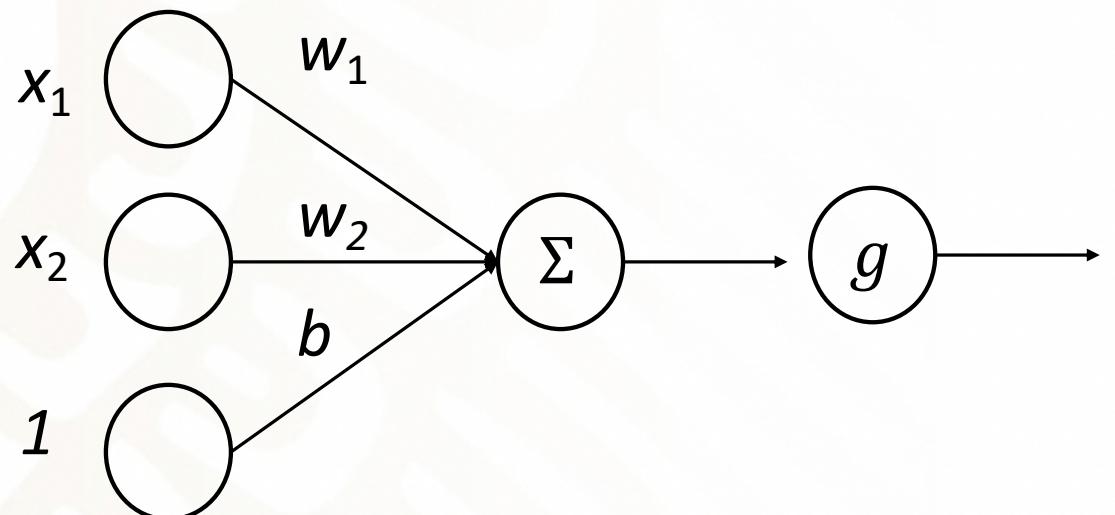

- Una opción es apilar múltiples capas de unidades lineales
 - Aún así, solo es posible aprender funciones lineales
- Idea: Apilar múltiples capas de unidades lineales activadas con funciones no lineales

Unidades no lineales

- Apilar múltiples capas de unidades lineales activadas con funciones no lineales

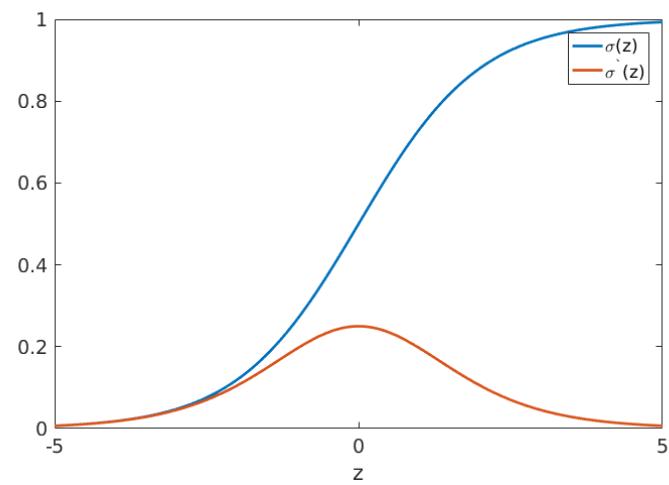

Se añade una función no lineal a la salida

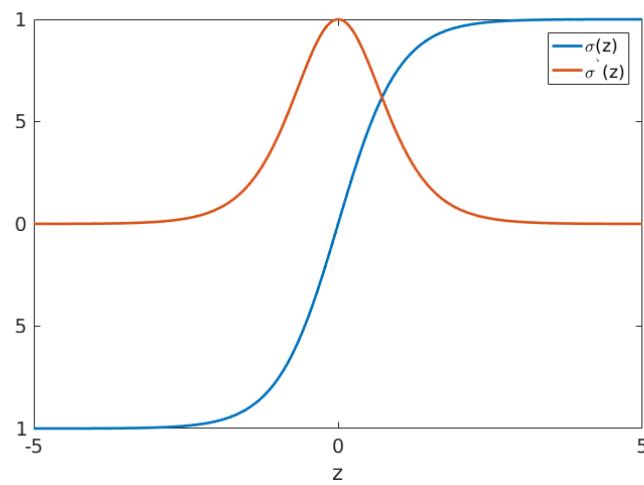

$$y = g(w_1x_1 + w_2x_2 + b)$$

Unidades no lineales

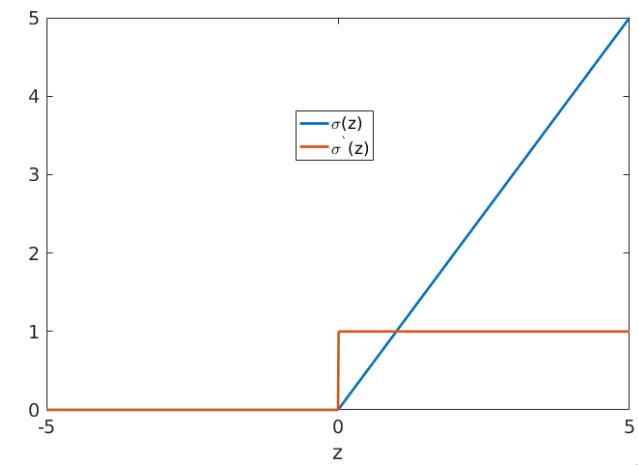

- Algunas funciones de activación:

Sigmoide

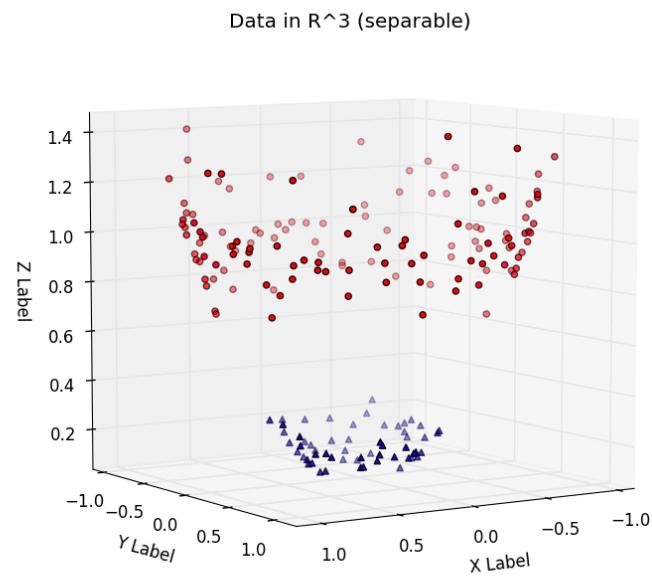

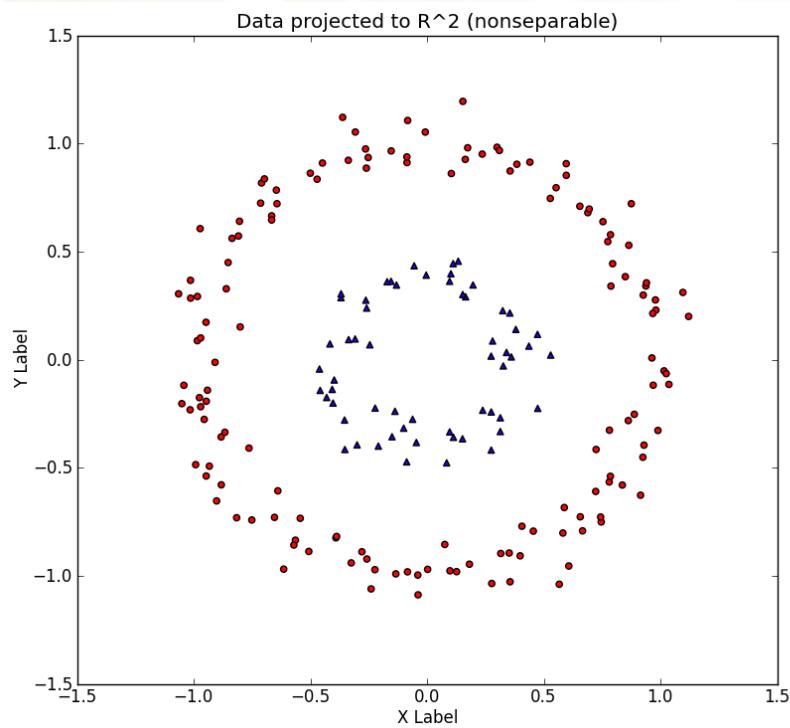

Tangente hiperbólica

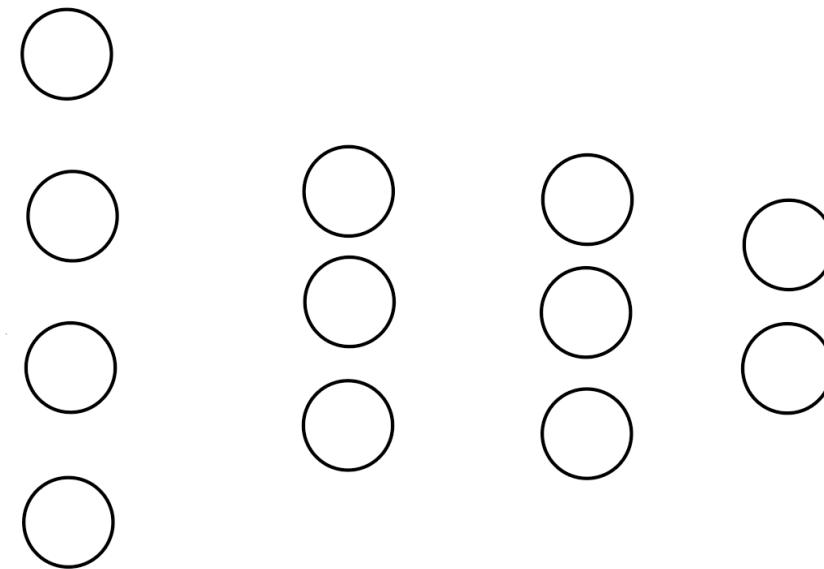

ReLU

$$z_6 = g\left(\sum_i w_{6,i} x_{6,i}\right)$$

$$z_7 = g\left(\sum_i w_{7,i} x_{7,i}\right)$$

$$z_8 = g\left(\sum_i w_{8,i} x_{8,i}\right)$$

$$z_9 = g\left(\sum_i w_{9,i} x_{9,i}\right)$$

$$z_{10} = g\left(\sum_i w_{10,i} x_{10,i}\right)$$

$$z_{11} = g\left(\sum_i w_{11,i} x_{11,i}\right)$$

$$z_{12} = g\left(\sum_i w_{12,i} x_{12,i}\right)$$

DNNs

$$z_8 = g(\sum_i w_{8,i} x_{8,i})$$

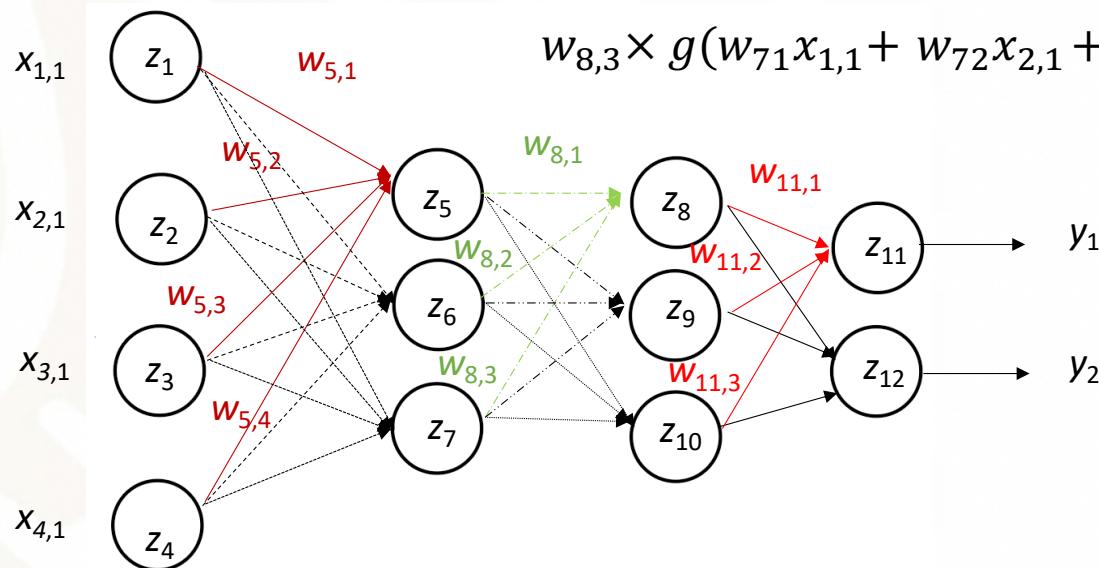

$$z_8 = g(w_{8,1}z_5 + w_{8,2}z_6 + w_{8,3}z_7)$$

$$z_8 = g(w_{8,1} \times g(w_{51}x_{1,1} + w_{52}x_{2,1} + w_{53}x_{3,1} + w_{54}x_{4,1})) \dots$$

$$w_{8,2} \times g(w_{61}x_{1,1} + w_{62}x_{2,1} + w_{63}x_{3,1} + w_{64}x_{4,1}) + \dots$$

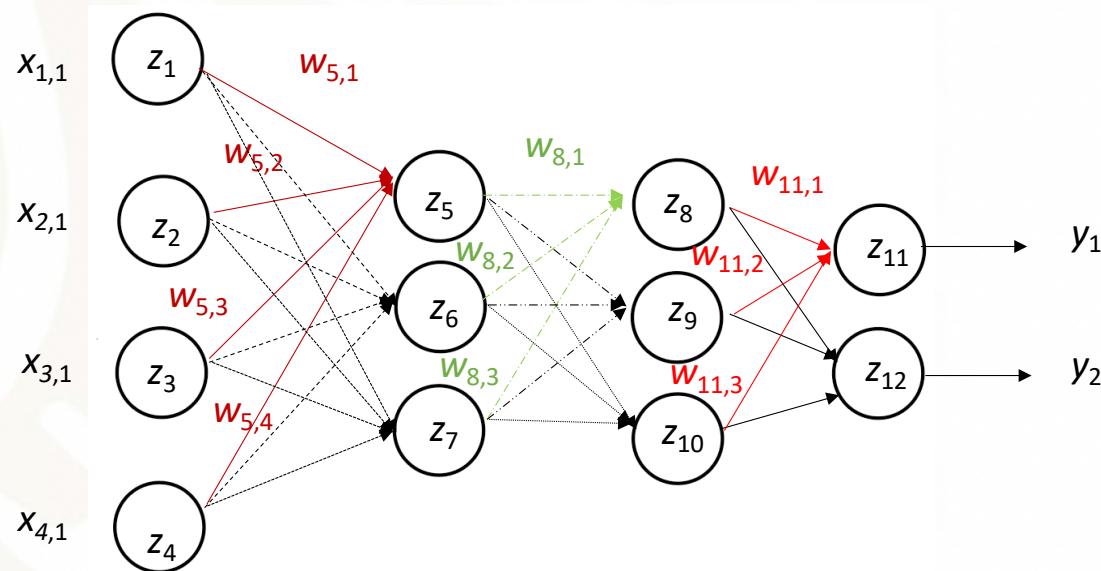

$$w_{8,3} \times g(w_{71}x_{1,1} + w_{72}x_{2,1} + w_{73}x_{3,1} + w_{74}x_{4,1}))$$

$$z_8 = g(\sum_i w_{8,i} g(\sum_{j \in inputs-z_8} z_j))$$

$$inputs - z_i = \{z_j | \exists z_j \rightarrow z_i\}$$

DNNs

$$z_8 = g\left(\sum_i w_{8,i} g\left(\sum_{j \in \text{inputs}-z_8} z_j\right)\right)$$

$$\text{inputs} - z_i = \{z_j | \exists z_j \rightarrow z_i\}$$

Entrenamiento de una red neuronal

DNNs

- Observaciones:

- La red debe aprender a mapear entradas a salidas, a partir de ejemplos
- La información siempre fluye hacia adelante
- Las funciones de activación podrían ser diferentes para cada unidad
- Las unidades de entrada son fijas (dadas por el problema)
- Las unidades de salida están fijas para datos de entrenamiento y son desconocidas para cualquier otra muestra
- Los parámetros W deben estimarse
- El número de capas y unidades en cada capa son definidas por el diseñador
- Las redes neuronales son aproximadores universales de funciones

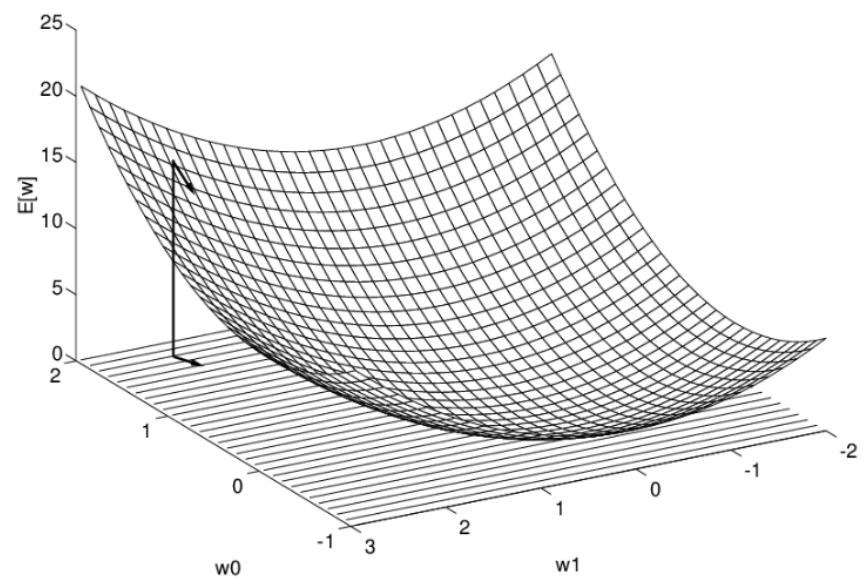

DNNs

- El entrenamiento de la red consiste en aprender los pesos de la red que minimizan un estimado del error
 - Cuántos parámetros?
 - Cómo determinar el valor de los pesos?
 - Qué criterio adoptar?

DNNs

- El método de retro propagación con gradiente descendente se usa para aprender pesos
 - Usar gradiente descendente para aprender los pesos que mejor se ajustan a los datos D
 - Uso de la regla de la cadena para distribuir el gradiente del error con respecto a los pesos

DNNs

$$z_8 = g(\sum_i w_{8,i} x_{8,i})$$

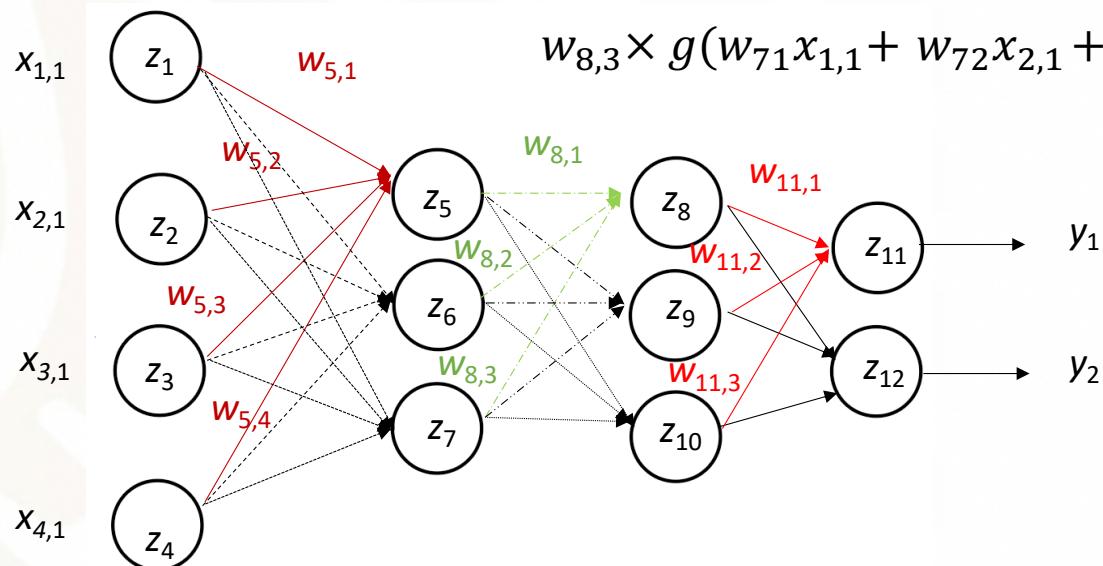

$$z_8 = g(w_{8,1}z_5 + w_{8,2}z_6 + w_{8,3}z_7)$$

$$z_8 = g(w_{8,1} \times g(w_{51}x_{1,1} + w_{52}x_{2,1} + w_{53}x_{3,1} + w_{54}x_{4,1}) \dots$$

$$w_{8,2} \times g(w_{61}x_{1,1} + w_{62}x_{2,1} + w_{63}x_{3,1} + w_{64}x_{4,1}) + \dots$$

$$w_{8,3} \times g(w_{71}x_{1,1} + w_{72}x_{2,1} + w_{73}x_{3,1} + w_{74}x_{4,1}))$$

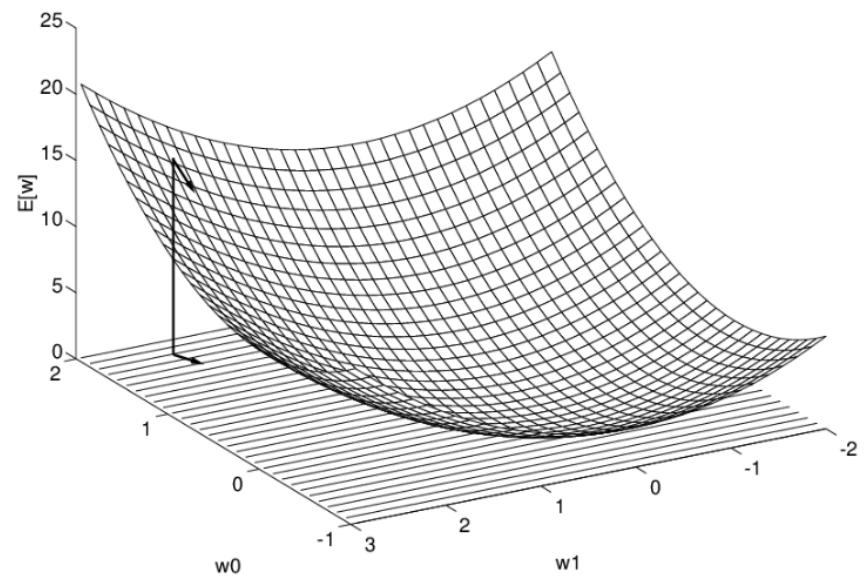

$$z_8 = g(\sum_i w_{8,i} g(\sum_{j \in inputs - z_8} z_j))$$

$$inputs - z_i = \{z_j | \exists z_j \rightarrow z_i\}$$

DNNs

- En términos generales:
 1. Inicializar todos los pesos de la red de manera aleatoria
 2. Alimentar los ejemplos de entrenamiento a la red y calcular el error
 3. Calcular el gradiente de la función de error con respecto a cada peso
 4. Actualizar el valor de pesos de acuerdo a (3)
 5. Repetir 2-4 hasta convergencia o alcanzar criterio de paro

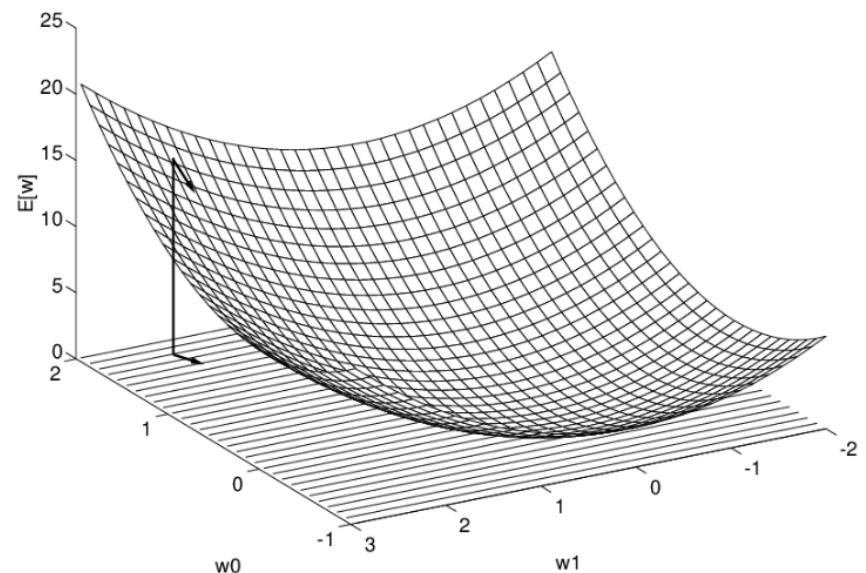

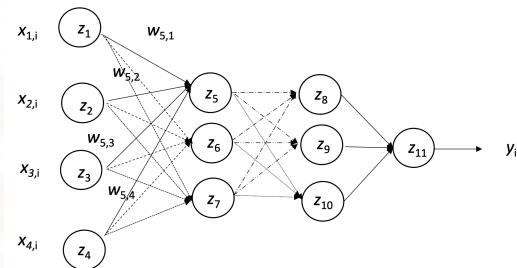

DNNs

- Requerimos:
 - Definir función de error E (dependiente del problema)
 - Calcular el gradiente de E con respecto a W

$$E(\mathbf{w}) = \min \frac{1}{2} \sum_{i=1}^m (y_i - f_{\mathbf{w}}(\mathbf{x}_i))^2$$

$$\frac{d E(\mathbf{w})}{d \mathbf{w}}$$

DNNs

- Queremos encontrar los pesos \mathbf{w} que minimizan:

$$E(\mathbf{w}) = \min \frac{1}{2} \sum_{i=1}^m (y_i - f_{\mathbf{w}}(\mathbf{x}_i))^2$$

- Usando gradiente descendente estocástico queremos actualizar los pesos con cada instancia k de la siguiente forma:

$$w_{j,i} \leftarrow w_{j,i} + \Delta w_{j,i}$$

$$\Delta w_{j,i} = -\eta \frac{E_k(w_{j,i})}{d w_{j,i}}$$

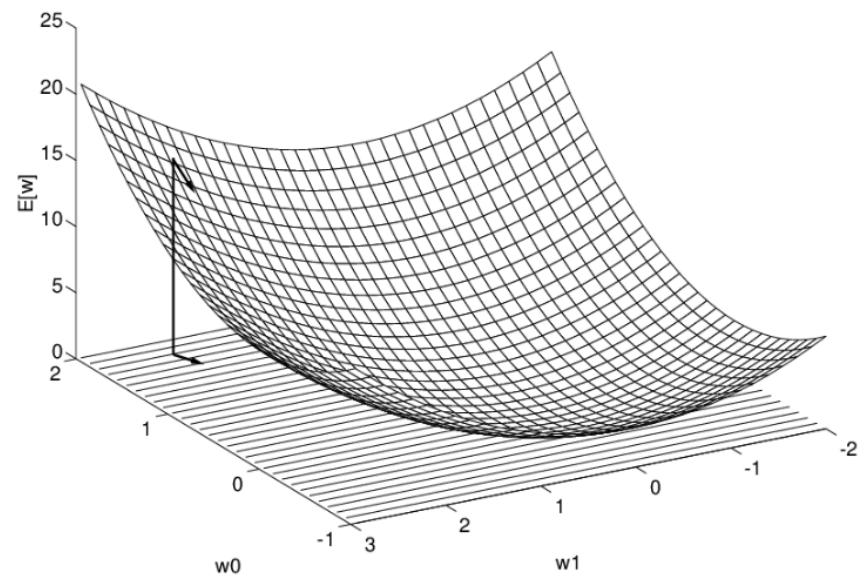

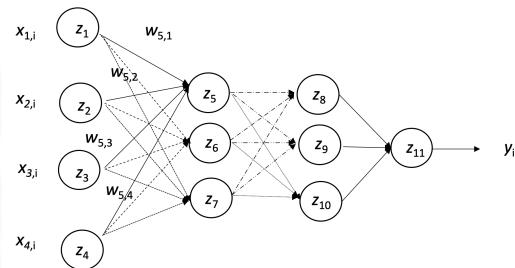

DNNs

- Requerimos:
 - Definir función de error E (dependiente del problema)
 - Calcular el gradiente de E con respecto a W

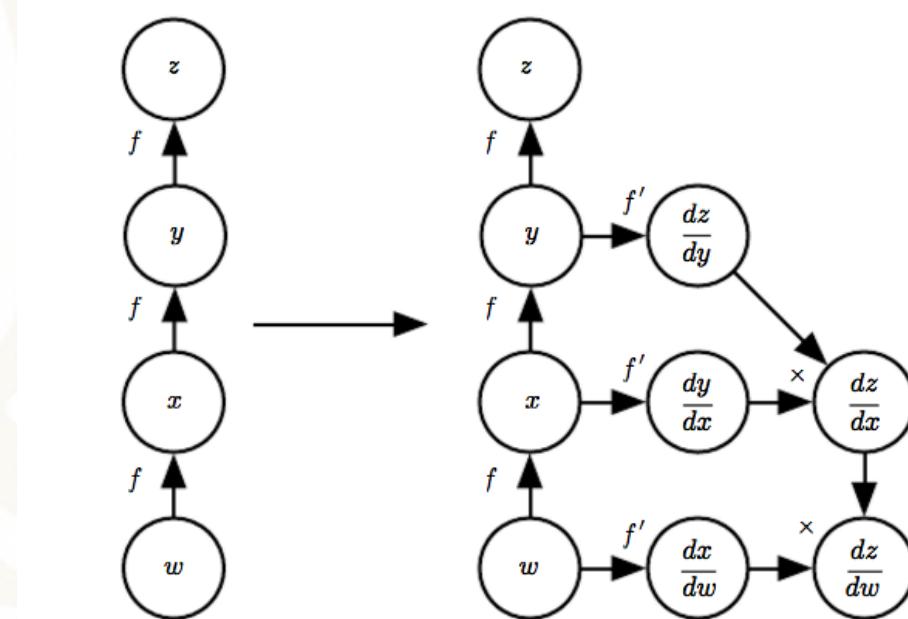

$$E(\mathbf{w}) = \min \frac{1}{2} \sum_{i=1}^m (y_i - f_{\mathbf{w}}(\mathbf{x}_i))^2$$

$$\frac{d E(\mathbf{w})}{d \mathbf{w}}$$

T. Mitchell. **Machine Learning**, McGrawHill 1997,

BACKPROPAGATION(*training_examples*, η , n_{in} , n_{out} , n_{hidden})

Each training example is a pair of the form (\vec{x}, \vec{t}) , where \vec{x} is the vector of network input values, and \vec{t} is the vector of target network output values.

η is the learning rate (e.g., .05). n_{in} is the number of network inputs, n_{hidden} the number of units in the hidden layer, and n_{out} the number of output units.

The input from unit i into unit j is denoted x_{ji} , and the weight from unit i to unit j is denoted w_{ji} .

- Create a feed-forward network with n_{in} inputs, n_{hidden} hidden units, and n_{out} output units.
- Initialize all network weights to small random numbers (e.g., between $-.05$ and $.05$).
- Until the termination condition is met, Do
 - For each (\vec{x}, \vec{t}) in *training_examples*, Do

Propagate the input forward through the network:

1. Input the instance \vec{x} to the network and compute the output o_u of every unit u in the network.

Propagate the errors backward through the network:

2. For each network output unit k , calculate its error term δ_k

$$\delta_k \leftarrow o_k(1 - o_k)(t_k - o_k) \quad (\text{T4.3})$$

3. For each hidden unit h , calculate its error term δ_h

$$\delta_h \leftarrow o_h(1 - o_h) \sum_{k \in \text{outputs}} w_{kh} \delta_k \quad (\text{T4.4})$$

4. Update each network weight w_{ji}

$$w_{ji} \leftarrow w_{ji} + \Delta w_{ji}$$

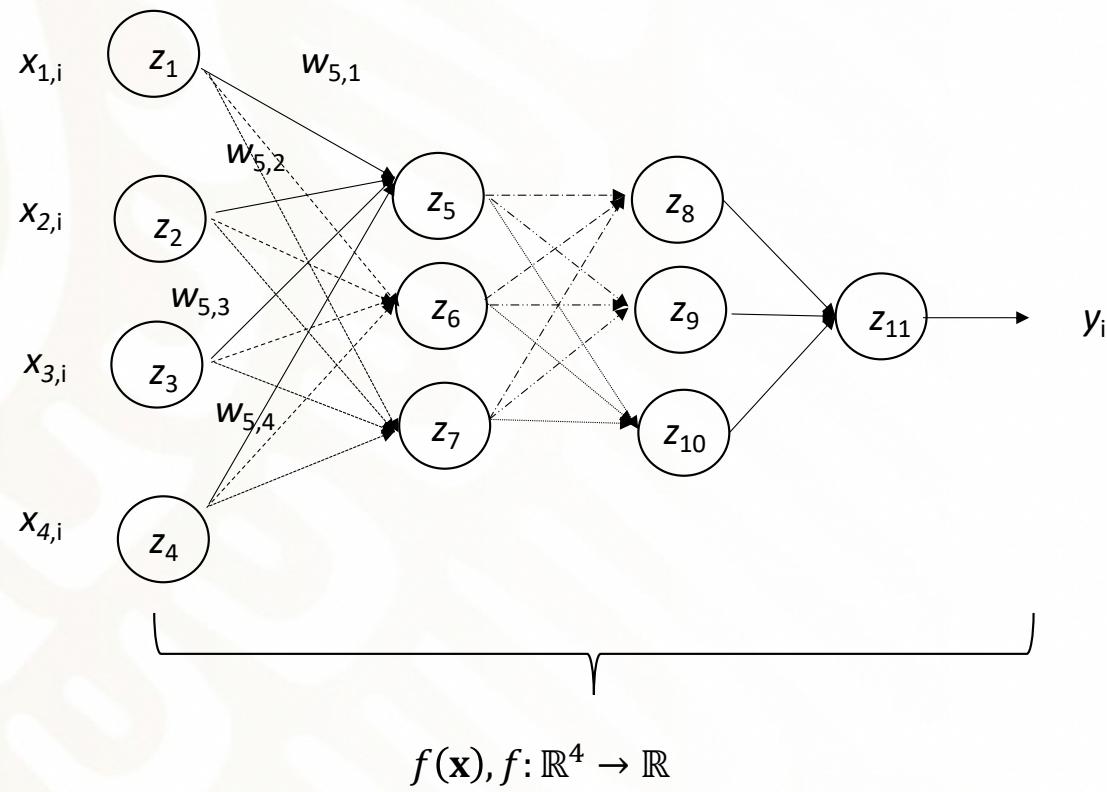

where

$$\Delta w_{ji} = \eta \delta_j x_{ji} \quad (\text{T4.5})$$

DNNs – entrenamiento

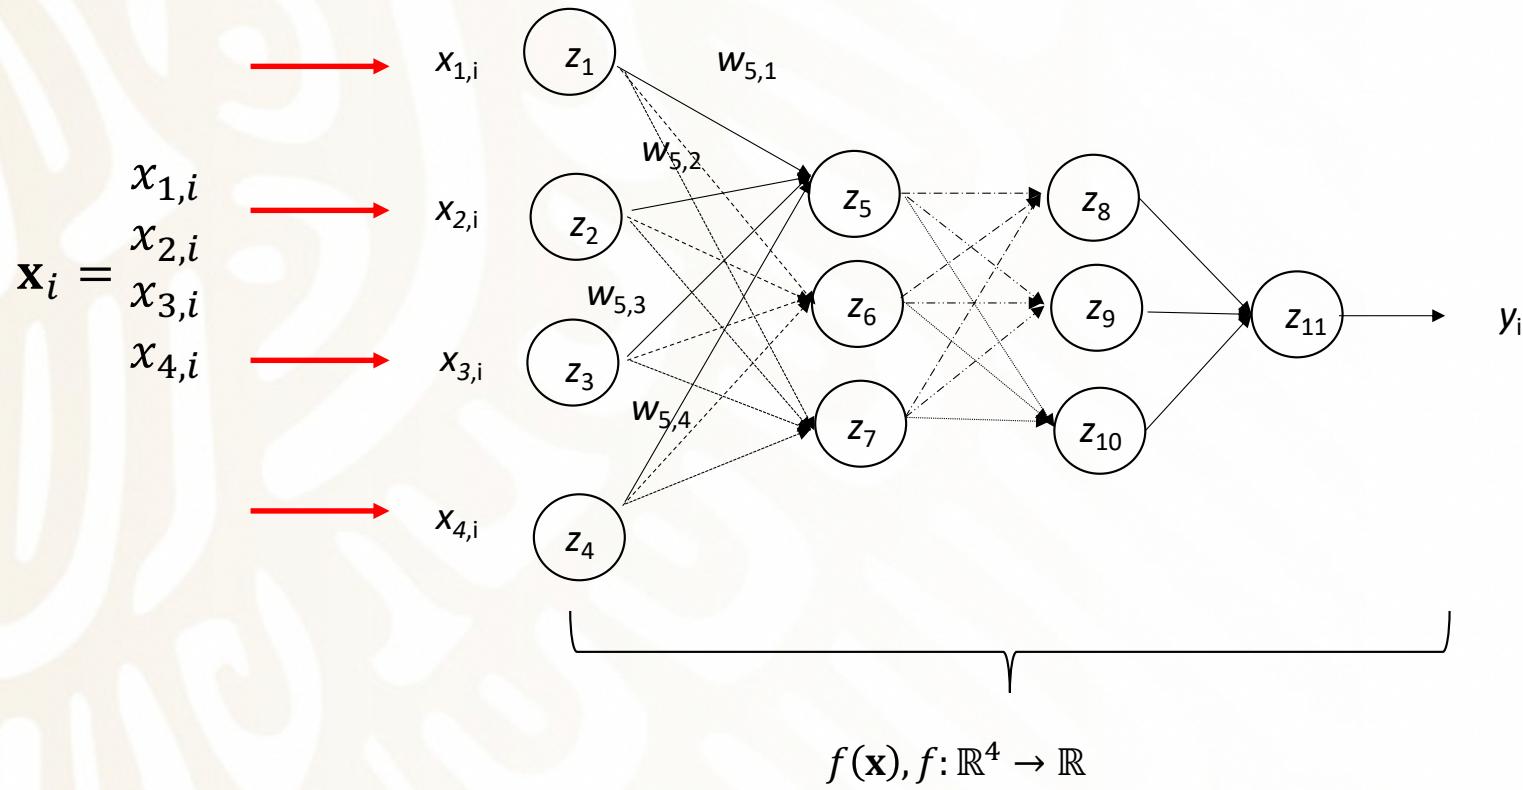

$$\mathbf{x}_i = \begin{matrix} x_{1,i} \\ x_{2,i} \\ x_{3,i} \\ x_{4,i} \end{matrix}$$

DNNs – entrenamiento

DNNs

- Las redes neuronales profundas son simplemente redes neuronales con varias capas ocultas (el número de capas indican la profundidad)
- Es posible ver a una DNN como la anidación de funciones:
 - $f^n(f^{n-1}(f^{n-2}(\dots f^1(\mathbf{x}))))$
- La capa oculta es usualmente lo que conecta directamente a la tarea con la red
- Las capas intermedias/ocultas capturan información de los datos de manera indirecta con respecto al objetivo
- Usualmente hay millones de parámetros que deben ser aprendidos, aun así retro propagación funciona

DNNs

- Componentes de una DNN
 - Unidades de salida
 - Unidades ocultas
 - Estrategia de aprendizaje
 - Función de costo
 - ...

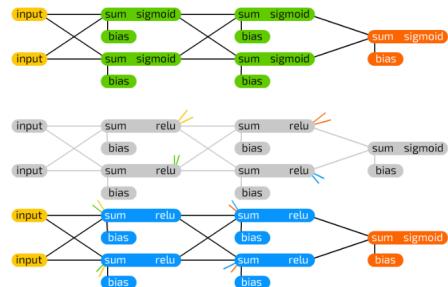

DNNs – consideraciones

- **Diseño de la arquitectura:** Un arte! (apilamiento de capas, Reducción de unidades en capas de niveles más profundos, entre más profundo mejor, usualmente)
- **Entrenamiento de DNNs:** Retro propagación con SGD, más momentum, mini-batches, ...
- **Regularización:** Dropout, entrenamiento con adversario, early stopping,
- **Implementación:** GPU
